

## ISO7840x 高性能、8000V<sub>PK</sub> 增强型四通道数字隔离器

### 1 特性

- 信号传输速率：高达 100Mbps
- 宽电源电压范围：2.25V 至 5.5V
- 2.25V 至 5.5V 电平转换
- 宽温度范围：-55°C 至 +125°C
- 低功耗：电流典型值为 1.7mA/通道（1Mbps 时）
- 低传播延迟：典型值为 11ns（5V 电源供电时）
- 行业领先的 CMTI（最小值）：±100 kV/μs
- 优异的电磁兼容性 (EMC)
- 系统级静电放电 (ESD)、瞬态放电 (EFT) 以及抗浪涌保护
- 低辐射
- 隔离层寿命：40 年以上
- 宽体 SOIC-16 封装和超宽体 SOIC-16 封装选项
- 安全及管理批准：中的“安全及管理批准”列表中的“安全及管理批准”列表
  - 8000 V<sub>PK</sub> 增强型隔离，符合 DIN V VDE V 0884-10 (VDE V 0884-10)：2006-12
  - 符合 UL 1577 标准且长达 1 分钟的 5.7kV<sub>RMS</sub> 隔离
  - CSA 组件验收通知 5A, IEC 60950-1 和 IEC 60601-1 终端设备标准
  - 符合 GB4943.1-2011 标准的 CQC 认证
  - 符合 EN 61010-1 和 EN 60950-1 标准的 TUV 认证
  - 完成了所有 DW 封装认证；完成了符合 UL、VDE、TUV 标准的 DWW 封装认证并且已针对 CSA 和 CQC 进行了规划

### 2 应用

- 工业自动化
- 电机控制
- 电源
- 太阳能逆变器
- 医疗设备
- 混合动力电动汽车

### 3 说明

ISO7840x 器件是一款高性能四通道数字隔离器，隔离电压为 8000V<sub>PK</sub>。该器件已通过符合 VDE、CSA、CQC 和 TUV 标准的增强型隔离认证。在隔离互补金属氧化物半导体 (CMOS) 或者低电压互补金属氧化物半导体 (LVCMOS) 数字 I/O 时，该隔离器可提供高电磁抗扰度和低辐射，同时具备低功耗特性。每个隔离通道都有一个由二氧化硅 (SiO<sub>2</sub>) 绝缘隔栅分开的逻辑输入和输出缓冲器。

该器件配有使能引脚，可用于将多个主驱动应用中的相应输出置于高阻抗状态，也可用于降低功耗。

ISO7840 器件具有 4 个正向通道和 0 个反向通道。如果出现输入功率或信号丢失，ISO7840 器件默认输出高电平，ISO7840F 器件默认输出低电平。有关更多详细信息，请参阅 [Device Functional Modes](#) 器件功能模式部分。

与隔离式电源结合使用时，该器件有助于防止数据总线或者其他电路中的噪声电流进入本地接地，进而干扰或损坏敏感电路。凭借创新的芯片设计和布线技术，ISO7840 器件的电磁兼容性得到了显著增强，可确保提供系统级 ESD、EFT 和浪涌保护并符合辐射标准。

ISO7840 器件采用 16 引脚 SOIC 宽体 (DW) 和超宽体 (DWW) 封装。

## 6 Specifications

### 6.1 Absolute Maximum Ratings

See <sup>(1)</sup>

		MIN	MAX	UNIT
$V_{CC1}$ , $V_{CC2}$	Supply voltage <sup>(2)</sup>	-0.5	6	V
Voltage	INx	-0.5	$V_{CCX} + 0.5$ <sup>(3)</sup>	V
	OUTx	-0.5	$V_{CCX} + 0.5$ <sup>(3)</sup>	
	EN2	-0.5	$V_{CCX} + 0.5$ <sup>(3)</sup>	
$I_O$	Output current	-15	15	mA
	Surge immunity		12.8	kV
$T_{stg}$	Storage temperature	-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values except differential I/O bus voltages are with respect to the local ground terminal (GND1 or GND2) and are peak voltage values.
- (3) Maximum voltage must not exceed 6 V

### 6.2 ESD Ratings

		VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins <sup>(1)</sup>	±6000
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins <sup>(2)</sup>	±1500

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

		$V_{CCO}^{(1)} = 3.3$ V		2	
		$V_{CCO}^{(1)} = 2.5$ V		1	
$V_{IH}$	High-level input voltage	$0.7 \times V_{CCI}^{(1)}$		$V_{CCI}^{(1)}$	V
$V_{IL}$	Low-level input voltage	0		$0.3 \times V_{CCI}^{(1)}$	V
DR	Signaling rate	0		100	Mbps
$T_J$	Junction temperature <sup>(2)</sup>	-55		150	°C
$T_A$	Ambient temperature	-55	25	125	°C

- (1)  $V_{CCI}$  = Input-side  $V_{CC}$ ;  $V_{CCO}$  = Output-side  $V_{CC}$ .
- (2) To maintain the recommended operating conditions for  $T_J$ , see [Thermal Information](#).

- Creepage and clearance requirements should be applied according to the specific equipment isolation standards of an application. Care should be taken to maintain the creepage and clearance distance of a board design to ensure that the mounting pads of the isolator on the printed-circuit board do not reduce this distance. Creepage and clearance on a printed-circuit board become equal in certain cases. Techniques such as inserting grooves, ribs, or both on a printed circuit board are used to help increase these specifications.
- This coupler is suitable for *safe electrical insulation* only within the safety ratings. Compliance with the safety ratings shall be ensured by means of suitable protective circuits.
- Testing is carried out in air or oil to determine the intrinsic surge immunity of the isolation barrier.
- Apparent charge is electrical discharge caused by a partial discharge (pd).
- All pins on each side of the barrier tied together creating a two-pin device.

## 6.8 Safety Limiting Values

Safety limiting intends to minimize potential damage to the isolation barrier upon failure of input or output circuitry. A failure of the I/O can allow low resistance to ground or the supply and, without current limiting, dissipate sufficient power to overheat the die and damage the isolation barrier potentially leading to secondary system failures.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
I <sub>S</sub>	Safety input, output, or supply current	R <sub>θJA</sub> = 78.9°C/W, V <sub>I</sub> = 5.5 V, T <sub>J</sub> = 150°C, T <sub>A</sub> = 25°C			288	mA
		R <sub>θJA</sub> = 78.9°C/W, V <sub>I</sub> = 3.6 V, T <sub>J</sub> = 150°C, T <sub>A</sub> = 25°C			440	
		R <sub>θJA</sub> = 78.9°C/W, V <sub>I</sub> = 2.75 V, T <sub>J</sub> = 150°C, T <sub>A</sub> = 25°C			576	
P <sub>S</sub>	Safety input, output, or total power	R <sub>θJA</sub> = 78.9°C/W, T <sub>J</sub> = 150°C, T <sub>A</sub> = 25°C			1584	mW
T <sub>S</sub>	Maximum safety temperature				150	°C

The maximum safety temperature is the maximum junction temperature specified for the device. The power dissipation and junction-to-air thermal impedance of the device installed in the application hardware determines the junction temperature. The assumed junction-to-air thermal resistance in the [Thermal Information](#) is that of a device installed on a high-K test board for leaded surface-mount packages. The power is the recommended maximum input voltage times the current. The junction temperature is then the ambient temperature plus the power times the junction-to-air thermal resistance.

## 8 Detailed Description

### 8.1 Overview

The ISO7840 device uses an ON-OFF keying (OOK) modulation scheme to transmit the digital data across a silicon-dioxide based isolation barrier. The transmitter sends a high-frequency carrier across the barrier to represent one digital state and sends no signal to represent the other digital state. The receiver demodulates the signal after advanced signal conditioning and produces the output through a buffer stage. If the EN pin is low then the output goes to high impedance. The ISO7840 device also incorporates advanced circuit techniques to maximize the CMTI performance and minimize the radiated emissions because of the high-frequency carrier and IO buffer switching. The conceptual block diagram of a digital capacitive isolator, [Figure 15](#), shows a functional block diagram of a typical channel.

#### 8.3.1 Electromagnetic Compatibility (EMC) Considerations

Many applications in harsh industrial environment are sensitive to disturbances such as electrostatic discharge (ESD), electrical fast transient (EFT), surge, and electromagnetic emissions. These electromagnetic disturbances are regulated by international standards such as IEC 61000-4-x and CISPR 22. Although system-level performance and reliability depends, to a large extent, on the application board design and layout, the ISO7840 device incorporates many chip-level design improvements for overall system robustness. Some of these improvements include

- Robust ESD protection cells for input and output signal pins and inter-chip bond pads.
- Low-resistance connectivity of ESD cells to supply and ground pins.
- Enhanced performance of high voltage isolation capacitor for better tolerance of ESD, EFT and surge events.
- Bigger on-chip decoupling capacitors to bypass undesirable high energy signals through a low impedance path.
- PMOS and NMOS devices isolated from each other by using guard rings to avoid triggering of parasitic SCRs.
- Reduced common mode currents across the isolation barrier by ensuring purely differential internal operation.

### 8.4 Device Functional Modes

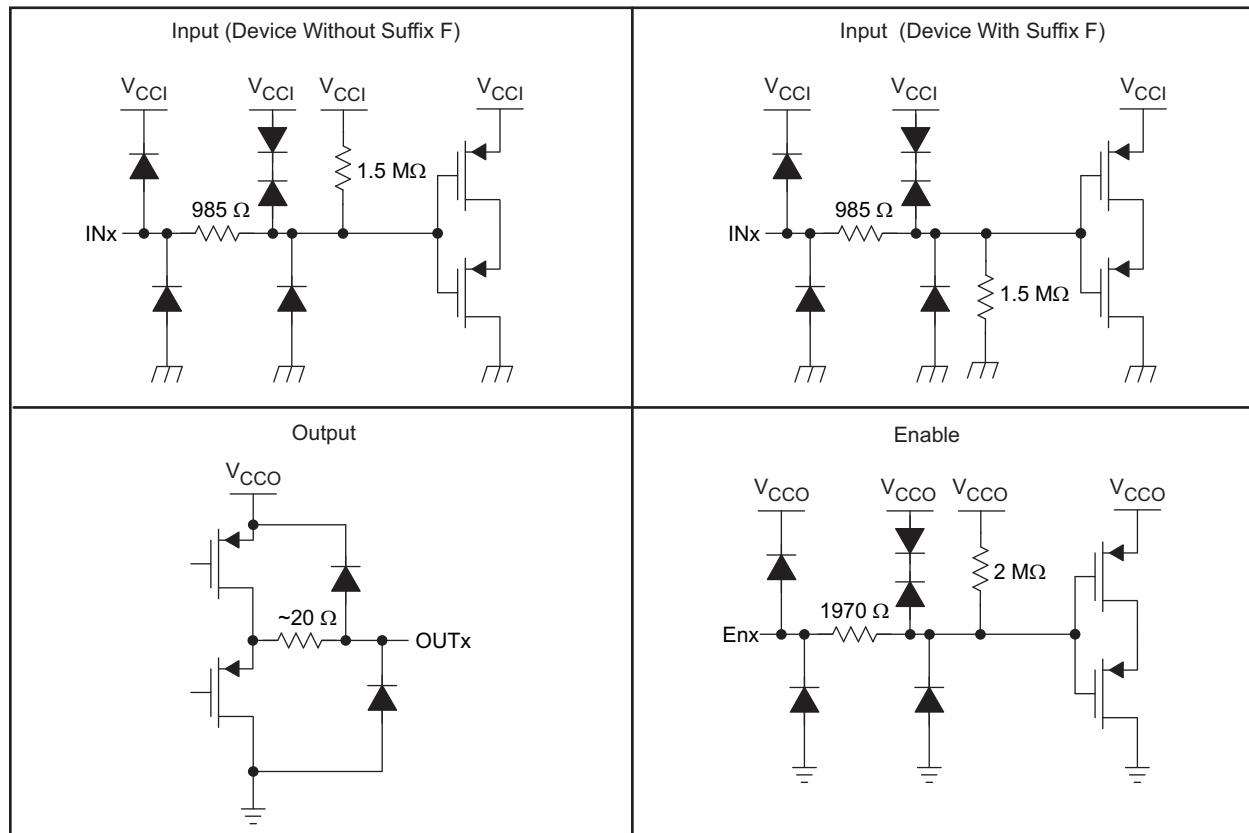

Table 2 lists the ISO7840 functional modes.

Table 2. Function Table <sup>(1)</sup>

V <sub>CCI</sub>	V <sub>CCO</sub>	INPUT (IN <sub>x</sub> ) <sup>(2)</sup>	OUTPUT ENABLE (EN <sub>2</sub> )	OUTPUT (OUT <sub>x</sub> )	COMMENTS
PU	PU	H	H or open	H	Normal Operation: A channel output assumes the logic state of its input.
		L	H or open	L	
		Open	H or open	Default	Default mode: When IN <sub>x</sub> is open, the corresponding channel output goes to its default logic state. Default= High for ISO7840 and Low for ISO7840F.
X	PU	X	L	Z	A low value of Output Enable causes the outputs to be high-impedance
PD	PU	X	H or open	Default	Default mode: When V <sub>CCI</sub> is unpowered, a channel output assumes the logic state based on the selected default option. Default= High for IISO7840 and Low for ISO7840F. When V <sub>CCI</sub> transitions from unpowered to powered-up, a channel output assumes the logic state of its input. When V <sub>CCI</sub> transitions from powered-up to unpowered, channel output assumes the selected default state.
X	PD	X	X	Undetermined	When V <sub>CCO</sub> is unpowered, a channel output is undetermined <sup>(3)</sup> . When V <sub>CCO</sub> transitions from unpowered to powered-up, a channel output assumes the logic state of its input

- (1) V<sub>CCI</sub> = Input-side V<sub>CC</sub>; V<sub>CCO</sub> = Output-side V<sub>CC</sub>; PU = Powered up (V<sub>CC</sub> ≥ 2.25 V); PD = Powered down (V<sub>CC</sub> ≤ 1.7 V); X = Irrelevant; H = High level; L = Low level ; Z = High Impedance
- (2) A strongly driven input signal can weakly power the floating V<sub>CC</sub> through an internal protection diode and cause undetermined output.
- (3) The outputs are in undetermined state when 1.7 V < V<sub>CCI</sub>, V<sub>CCO</sub> < 2.25 V.

## 9 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 9.1 Application Information

The ISO7840 device is a high-performance, quad-channel digital isolator with a 5.7-kV<sub>RMS</sub> isolation voltage. The device comes with enable pins on each side that can be used to put the respective outputs in high impedance for multi-master driving applications and reduce power consumption. The ISO7840 device uses single-ended CMOS-logic switching technology. The supply voltage range is from 2.25 V to 5.5 V for both supplies, V<sub>CC1</sub> and V<sub>CC2</sub>. When designing with digital isolators, keep in mind that because of the single-ended design structure, digital isolators do not conform to any specific interface standard and are only intended for isolating single-ended CMOS or TTL digital signal lines. The isolator is typically placed between the data controller (that is,  $\mu$ C or UART), and a data converter or a line transceiver, regardless of the interface type or standard.

### 9.2 Typical Application

Figure 18. Isolated Data Acquisition System for Process Control

## Typical Application (continued)

### 9.2.1 Design Requirements

For this design example, use the parameters shown in Table 3.

Table 3. Design Parameters

PARAMETER	VALUE
Supply voltage	2.25 to 5.5 V
Decoupling capacitor between V <sub>CC1</sub> and GND1	0.1 μF
Decoupling capacitor from V <sub>CC2</sub> and GND2	0.1 μF

### 9.2.2 Detailed Design Procedure

Unlike optocouplers, which require external components to improve performance, provide bias, or limit current, the ISO7840 device only requires two external bypass capacitors to operate.

Figure 19. Typical ISO7840 Circuit Hook-Up

### 9.2.3 Application Curve

The typical eye diagram of the ISO7840 device indicates low jitter and wide open eye at the maximum data rate of 100 Mbps.

Figure 20. Eye Diagram at 100 Mbps PRBS, 5 V and 25°C

## 10 Power Supply Recommendations

To help ensure reliable operation at data rates and supply voltages, a 0.1- $\mu$ F bypass capacitor is recommended at input and output supply pins ( $V_{CC1}$  and  $V_{CC2}$ ). The capacitors should be placed as close to the supply pins as possible. If only a single primary-side power supply is available in an application, isolated power can be generated for the secondary-side with the help of a transformer driver such as Texas Instruments [SN6501](#). For such applications, detailed power supply design and transformer selection recommendations are available in [SN6501 Transformer Driver for Isolated Power Supplies](#).

## 11 Layout

### 11.1 Layout Guidelines

A minimum of four layers is required to accomplish a low EMI PCB design (see [Figure 21](#)). Layer stacking should be in the following order (top-to-bottom): high-speed signal layer, ground plane, power plane and low-frequency signal layer.

- Routing the high-speed traces on the top layer avoids the use of vias (and the introduction of their inductances) and allows for clean interconnects between the isolator and the transmitter and receiver circuits of the data link.
- Placing a solid ground plane next to the high-speed signal layer establishes controlled impedance for transmission line interconnects and provides an excellent low-inductance path for the return current flow.
- Placing the power plane next to the ground plane creates additional high-frequency bypass capacitance of approximately 100 pF/inch<sup>2</sup>.
- Routing the slower speed control signals on the bottom layer allows for greater flexibility as these signal links usually have margin to tolerate discontinuities such as vias.

If an additional supply voltage plane or signal layer is needed, add a second power or ground plane system to the stack to keep it symmetrical. This makes the stack mechanically stable and prevents it from warping. Also the power and ground plane of each power system can be placed closer together, thus increasing the high-frequency bypass capacitance significantly.

For detailed layout recommendations, refer to [Digital Isolator Design Guide](#).

#### 11.1.1 PCB Material

For digital circuit boards operating at less than 150 Mbps, (or rise and fall times greater than 1 ns), and trace lengths of up to 10 inches, use standard FR-4 UL94V-0 printed circuit board. This PCB is preferred over cheaper alternatives because of lower dielectric losses at high frequencies, less moisture absorption, greater strength and stiffness, and the self-extinguishing flammability-characteristics.

NOTES: (continued)

- 7. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
- 8. Board assembly site may have different recommendations for stencil design.

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSELETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

<sup>(6)</sup> Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
