

TCA9617A 电平转换 FM+ I²C 总线中继器

1 特性

- 双通道双向 I²C 缓冲器
- 支持标准模式、快速模式 (400kHz) 和快速模式+ (1MHz) I²C 操作
- 在 A 侧上, 运行电源电压范围为 0.8V 至 5.5V
- 在 B 侧上, 运行电源电压范围为 2.2V 至 5.5V
- 从 0.8V 至 5.5V 和 2.2V 至 5.5V 的电压电平转换
- 针对 TCA9517 的封装和功能替代产品
- 高电平有效中继器启用输入
- 漏极开路 I²C I/O
- 5.5V 电压容错 I²C 和启用输入支持
- 混和模式信号操作
- 无闭锁操作
- 器件上支持时钟伸展和多主仲裁
- 锁断性能超过 100mA, 符合 JESD 78 II 类规范的要求
- 静电放电 (ESD) 保护性能超过 JESD 22 规范的要求
 - 4000V 人体放电模式 (A114-A)
 - 1500V 充电器件模型 (C101)

2 应用

- 服务器
- 路由器 (电信交换设备)
- 工业设备
- 具有多个 I²C 从器件和/或印刷电路板 (PCB) 走线较长的产品

3 说明

TCA9617A 是一款专门用于 I²C 总线和 SMBus 系统的 BiCMOS 双路双向缓冲器。此器件可在混合应用中提供低电压 (低至 0.8V) 和较高电压 (2.2V 至 5.5V) 间的双向电压水平转换 (上行转换模式和下行转换模式)。电平转换期间, 这个器件在不损失系统性能的情况下可扩展 I²C 和相似的总线系统。

TCA9617A 可缓冲 I²C 总线上的串行数据 (SDA) 和串行时钟 (SCL) 信号, 从而在 I²C 应用中连接 550pF 或更高总线电容的两条总线。这款器件也可用于将总线隔离为电压和电容两部分。

5 Pin Configuration and Functions

Pin Functions

PIN		DESCRIPTION
NAME	NO.	
VCCA	1	A-side supply voltage (0.8 V to 5.5 V)
SCLA	2	I ² C SCL line, A side. Connect to V _{CCA} through a pull-up resistor.
SDAA	3	I ² C SDA line, A side. Connect to V _{CCA} through a pull-up resistor.
GND	4	Supply ground
EN	5	Active-high repeater enable input
SDAB	6	I ² C SDA line, B side. Connect to V _{CCB} through a pull-up resistor.
SCLB	7	I ² C SCL line, B side. Connect to V _{CCB} through a pull-up resistor.
VCCB	8	B-side and device supply voltage (2.2 V to 5.5 V)

6 Specifications

6.1 Absolute Maximum Ratings⁽¹⁾

over operating free-air temperature range (unless otherwise noted)

			MIN	MAX	UNIT
V _{CCB}	Supply voltage range		–0.5	7	V
V _{CCA}	Supply voltage range		–0.5	7	V
V _I	Enable input voltage range ⁽²⁾		–0.5	7	V
V _{I/O}	I ² C bus voltage range ⁽²⁾		–0.5	7	V
I _{IK}	Input clamp current	V _I < 0		–50	mA
I _{OK}	Output clamp current	V _O < 0		–50	
I _O	Continuous output current			±50	mA
	Continuous current through V _{CC} or GND			±100	mA
T _{stg}	Storage temperature range		–65	150	°C

- (1) Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) The input negative-voltage and output voltage ratings may be exceeded if the input and output current ratings are observed.

6.2 ESD Ratings

			MIN	MAX	UNIT
V_{ESD}	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins ⁽¹⁾	0	4000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins ⁽²⁾	0	1500	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	MAX	UNIT
V_{CCA}	Supply voltage, A-side bus	0.8	V_{CCB}	V
V_{CCB}	Supply voltage, B-side bus	2.2	5.5	V
I_{OLA}	Low-level output current		30	mA
I_{OLB}	Low-level output current	0.1	30	mA
T_A	Operating free-air temperature	–40	85	°C

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		TCA9617A	UNIT
		DGK	
		8 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	171.8	°C/W

			0 V			14			

6.6 Timing Requirements

$V_{CCA} = 0.8 \text{ V to } 5.5 \text{ V}$, $V_{CCB} = 2.2 \text{ V to } 5.5 \text{ V}$, $GND = 0V$, $T_A = -40^\circ\text{C to } 85^\circ$ (unless otherwise noted)⁽¹⁾⁽²⁾

PARAMETER			FROM (INPUT)	TO (OUTPUT)	TEST CONDITIONS	MIN	TYP ⁽³⁾	MAX	UNIT
t _{PLH}	Propagation delay		SDAB, SCLB	SDAA, SCLA		42	55	90	ns
			SDAA, SCLA	SDAB, SCLB	V _{CCB} ≤ 3 V	61	88	137	
					V _{CCB} > 3 V	61	94	250	
t _{PHL}	Propagation delay		SDAB, SCLB	SDAA, SCLA		69	93	144	ns
			SDAA, SCLA	SDAB, SCLB		68	90	140	
t _{TLH} ⁽⁴⁾	Transition time	B side	30%	70%		88			ns
		A side				37			ns
t _{THL}	Transition time	B side	70%	30%		5.40	6.41	13.8	ns
		A side				1.40	4.71	11.3	
t _{SU}	Setup time, EN high before Start condition ⁽⁵⁾					100			ns

- (1) Times are specified with loads of $240 \Omega \pm 1\%$ and $400 \text{ pF} \pm 10\%$ on B-side and $240 \Omega \pm 1\%$ and $200 \text{ pF} \pm 10\%$ on A-side. Different load resistance and capacitance alter the rise time, thereby changing the propagation delay and transition times.
- (2) Times are specified with A-side signals pulled up to V_{CCA} ; $V_{CCA} = 0.9 \text{ V}$ and B-side signals pulled up to V_{CCB} ; $V_{CCB} = 2.5 \text{ V}$.
- (3) Typical values were measured with $V_{CCA} = 0.9 \text{ V}$ and $V_{CCB} = 2.5 \text{ V}$ at $T_A = 25^\circ\text{C}$, unless otherwise noted.
- (4) T_{TLH} is determined by the pullup resistance and load capacitance.
- (5) EN should change state only when the global bus and the repeater port are in an idle state.

6.7 Typical Characteristics

7 Parameter Measurement Information

Figure 3. Test Circuit for Open-Drain Output from A to B

- A. $V_{CCA} = 0.9 \text{ V}$
- B. $V_{CCB} = 2.5 \text{ V}$
- C. $R_{PUA} = R_{PUB} = 240 \Omega$ on the A-side and the B-side
- D. $C_{LA} = 200 \text{ pF}$ on A-side and $C_{LB} = 400 \text{ pF}$ on B-side (includes probe and jig capacitance)
- E. All input pulses are supplied by generators having the following characteristics: $PRR \leq 10 \text{ MHz}$, $Z_O = 50 \Omega$, slew rate $\geq 1 \text{ V/ns}$
- F. The outputs are measured one at a time, with one transition per measurement.

8 Detailed Description

8.1 Overview

The TCA9617A is a BiCMOS dual bidirectional buffer intended for I²C bus and SMBus systems. As with the standard I²C system, pullup resistors are required to provide the logic high levels on the buffered bus. The TCA9617A has standard open-drain configuration of the I²C bus. The size of these pullup resistors depends on the system, but each side of the repeater must have a pullup resistor. The device is designed to work with Standard mode, Fast mode and Fast Mode+ I²C devices.

The TCA9617A B-side drivers operate from 2.2 V to 5.5 V. The output low level for this internal buffer is approximately 0.5 V, but the input voltage must be 70 mV or more below the output low level when the output is externally driven low. The higher-voltage low signal is called a buffered low. When the B-side I/O is driven low internally, the low is not recognized as a low by the input. This feature prevents a lockup condition from occurring when the input low condition is released. This type of design on the B side prevents it from being used in series with another TCA9617A B-side or other buffers that incorporate a static or dynamic offset voltage. This is because these devices do not recognize buffered low signals as a valid low and do not propagate it as a buffered low again.

The TCA9617A A-side drivers operate from 0.8 V to 5.5 V and do not have the buffered low feature (or the static offset voltage). This means that a low signal on the B side translates to a nearly 0-V low on the A side, which accommodates smaller voltage swings of low-voltage logic. The output pulldown on the A side drives a hard low, and the input level is set to 0.3 V_{CCA} to accommodate the need for a lower low level in systems where the low-voltage-side supply voltage is as low as 0.8 V.

The A side of two or more TCA9617As can be connected together to allow a star topology, with the A side on the common bus. Also, the A side can be connected directly to any other buffer with static or dynamic offset voltage. Multiple TCA9617As can be connected in series, A side to B side, with no buildup in offset voltage with only time-of-flight delays to consider.

The TCA9617A includes a power-up circuit that keeps the output drivers turned off until V_{CCB} is above 2.0 V and V_{CCA} is above 0.7 V. V_{CCA} is only used to provide references for the A-side input comparators and the power-good-detect circuit. The TCA9617A internal circuitry and all I/Os are powered by the V_{CCB} pin; however, due to ESD protection requirements on the SCLA and SDAA, it is required to power-up V_{CCB} prior to V_{CCA}. If SDA and SCL (on A-side or B-side) are pulled up to a positive voltage before V_{CCB} is powered, there can be significant current leakage into the SCA and SCL pins that could cause them to be pulled down. The SDA and SCL lines shall not be pulled up to a voltage higher than V_{CCB}, even when the device is powered down.

After power up and with the EN high, the A side falling below 0.7 V_{CCA} turns on the corresponding B-side driver (either SDA or SCL) and drives the B-side down momentarily to 0 V before settling to approximately 0.5 V. When the A-side rises above 0.3 V_{CCA}, the B-side pulldown driver is turned off and the external pullup resistor pulls the pin high. If the B side falls first and goes below 0.7 V_{CCB}, the A-side driver is turned on and drives the A-side to 0 V. When the B-side rises above 0.45 V, the A-side pulldown driver is turned off and the external pullup resistor pulls the pin high.

8.3 Feature Description

8.3.1 Bidirectional Level Translation

The TCA9617A can provide bidirectional voltage level translation (up-translation and down-translation) between low voltages (down to 0.8 V) and higher voltages (2.2 V to 5.5 V) in mixed-mode applications.

8.3.2 V_{OL} B-side Offset Voltage

Figure 8 depicts the offset voltage on the B side of the device. As shown in Figure 8 the slave releases and the B-side rises, and it will rise to 0.5 V and stay there until the A-side rises above $0.3 V_{CCA}$. This effect can cause the low level signal to have a "pedestal." Once the voltage on the A-side crosses $0.3 V_{CCA}$, the B-side will continue to rise to V_{CCB} .

Due to nature of the B-side pedestal and the static offset voltage, there will be a slight overshoot (point 2) as the B-side rises from being externally driven low to the 0.5 V offset. The TCA9617A is designed to control this behavior provided the system is designed with rise times greater than 20 ns. Therefore, care should be taken to limit the pullup strength when devices with rise time accelerators are present on the B side. Excessive overshoot on the B-side pedestal may cause devices with rise time accelerators to trip prematurely if the accelerator thresholds are below $0.3 V_{CCB}$. Since the A-side does not have a static offset low voltage, no pedestal is seen on the A-side as shown in Figure 7.

Feature Description (continued)

8.3.3 High to Low Transition Characteristics

When the A side of the bus is driven to $0.7 V_{CCA}$, the B side driver will turn on. This will drive the B-side to 0 V for a short period (see Figure 8) and then the B-side will rise to the static offset voltage of 0.5 V (V_{OL} of TCA9617A). This effect, called an inverted pedestal, allows the B-side to drive to logic low much faster than driving to the static offset. Driving to the static offset voltage requires that the fall time be slowed to prevent ringing.

Figure 7. Bus A (0.8 V to 5.5 V Bus) Waveform

Figure 8. Bus B (2.2 V to 5.5 V Bus) Waveform

8.4 Device Functional Modes

The TCA9617A has an active-high enable (EN) input with an internal pull-up to V_{CCB} , which allows the user to select when the repeater is active. This can be used to isolate a badly behaved slave on power-up reset. It should never change state during an I²C operation, because disabling during a bus operation may hang the bus, and enabling part way through the bus cycles could confuse the I²C parts being enabled. The EN input should change state only when the global bus and repeater port are in the idle state to prevent system failures.

Table 1. Function Table

INPUT EN	FUNCTION
L	Outputs disabled
H	SDAA = SDAB SCLA = SCLB

9 Application and Implementation

9.1 Application Information

A typical application is shown in [Figure 9](#). In this example, the system master is running on a 0.9-V I²C bus, and the slave is connected to a 2.5-V bus. Both buses are running at 400 kHz. Decoupling capacitors are required but are not shown in [Figure 14](#) for simplicity.

The TCA9617A is 5-V tolerant so no additional circuits are required to translate between 0.8-V to 5.5-V bus voltages and 2.7-V to 5.5-V bus voltages.

When the A side of the TCA9617A is pulled low by a driver on the I²C bus, a comparator detects the falling edge when it goes below 0.7 V_{CCA} and cause the internal driver on the B side to turn on. The B-side will first pull down to 0 V and then settle to 0.5 V. When the B side of the TCA9617A falls below 0.45 V, the TCA9617A will detect the falling edge, turn on the internal driver on the A side and pull the A-side pin down to ground. In order to illustrate what would be seen for an A to B transition refer to [Figure 11](#), and for a B to A transition see [Figure 10](#).

On the B-side bus of the TCA9617A, the clock and data lines will have a positive offset from ground equal to the V_{OL} of the TCA9617A. After the eighth clock pulse, the data line is pulled to the V_{OL} of the slave device, which is close to ground in this example. At the end of the acknowledge, the level rises only to the low level set by the driver of the TCA9617A for a short delay (approximately 0.5 V), while the A-side bus rises above 0.3 V_{CCA} and then continues high.

Although the TCA9617 has a single application, the device can exist in multiple configurations. [Figure 9](#) shows the standard configuration for the TCA9617. Multiple TCA9617s can be connected either in star configuration ([Figure 12](#)) or in series configuration ([Figure 13](#)). The design requirements, detailed design procedure, and application curves in [Standard Application](#) are valid for all three configurations.

9.2 Typical Application

9.2.1 Standard Application

Figure 9. Bidirectional Voltage Level Translator

9.2.1.1 Design Requirements

For the level-translating application, the following should be true:

- V_{CCA} = 0.8 V to 5.5 V
- V_{CCB} = 2.2 V to 5.5 V
- I_{OL} > I_O

Typical Application (continued)

9.2.1.2 Detailed Design Procedure

9.2.1.2.1 Pullup Resistor Sizing

For the TCA9617A to function correctly, all devices on the B-side must be able to pull the B-side below the voltage input low contention level (0.45 V). This means that the V_{OL} of any device on the B-side must be below 0.4 V to ensure proper operation.

The V_{OL} of a device can be adjusted by changing the I_{OL} through the device which is set by the pull-up resistor value. The pull-up resistor on the B-side must be carefully selected to ensure that logic levels will be transferred correctly to the A-side.

The B-side pull-up resistor sizing must also ensure that the rise time is greater than 20 ns. Shorter rise times will increase the pedestal overshoot shown in point 2 of [Figure 10](#).

9.2.1.3 Application Curves

Typical Application (continued)

9.2.2 Star Application

Multiple TCA9617A A sides can be connected in a star configuration, allowing all nodes to communicate with each other.

Figure 12. Typical Star Application

9.2.2.1 Design Requirements

Refer to [Design Requirements](#).

9.2.2.2 Detailed Design Procedure

Refer to [Detailed Design Procedure](#).

9.2.2.3 Application Curves

Refer to [Application Curves](#).

Typical Application (continued)

9.2.3 Series Application

Multiple TCA9617As can be connected in series as long as the A side is connected to the B side. I²C bus slave devices can be connected to any of the bus segments. The number of devices that can be connected in series is limited by repeater delay/time-of-flight considerations on the maximum bus speed requirements.

Figure 13. Typical Series Application

9.2.3.1 Design Requirements

Refer to [Design Requirements](#).

9.2.3.2 Detailed Design Procedure

Refer to [Detailed Design Procedure](#).

9.2.3.3 Application Curves

Refer to [Application Curves](#).

10 Power Supply Recommendations

For VCCA, an 0.8-V to 5.5-V power supply is required. For VCCB, a 2.2-V to 5.5-V power supply is required.

VCCB should always be higher than VCCA. VCCB cannot be lower than VCCA even when the device is disabled. During power-up, VCCB must rise before VCCA.

Standard decoupling capacitors are recommended. These capacitors typically range from 0.1 μ F to 1 μ F, but the ideal capacitance depends on the amount of noise from the power supply.

11 Layout

11.1 Layout Guidelines

The recommended decoupling capacitors should be placed as close to the VCCA and VCCB pins of the TCA9617A as possible.

11.2 Layout Example

Figure 14. Layout Schematic

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TCA9617ADGKR	ACTIVE	VSSOP	DGK	8	2500	RoHS & Green	NIPDAUAG SN	Level-1-260C-UNLIM	-40 to 85	(7EA, DWK)	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBsolete: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

TAPE AND REEL INFORMATION

*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant
TCA9617ADGKR	VSSOP	DGK	8	2500	330.0	12.4	5.3	3.4	1.4	8.0	12.0	Q1

TAPE AND REEL BOX DIMENSIONS

*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Length (mm)	Width (mm)	Height (mm)
TCA9617ADGKR	VSSOP	DGK	8	2500	364.0	364.0	27.0

PLASTIC SMALL-OUTLINE PACKAGE

NOTES:

- A. All linear dimensions are in millimeters.
- B. This drawing is subject to change without notice.
- C. Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 per end.
- D. Body width does not include interlead flash. Interlead flash shall not exceed 0.50 per side.
- E. Falls within JEDEC MO-187 variation AA, except interlead flash.

DGK (S-PDSO-G8)

PLASTIC SMALL OUTLINE PACKAGE

- NOTES:
- All linear dimensions are in millimeters.
 - This drawing is subject to change without notice.
 - Publication IPC-7351 is recommended for alternate designs.
 - Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525 for other stencil recommendations.
 - Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

重要声明和免责声明

TI“按原样”提供技术和可靠性数据（包括数据表）、设计资源（包括参考设计）、应用或其他设计建议、网络工具、安全信息和其他资源，不保证没有瑕疵且不做任何明示或暗示的担保，包括但不限于对适销性、某特定用途方面的适用性或不侵犯任何第三方知识产权的暗示担保。

这些资源可供使用 TI 产品进行设计的熟练开发人员使用。您将自行承担以下全部责任：(1) 针对您的应用选择合适的 TI 产品，(2) 设计、验证并测试您的应用，(3) 确保您的应用满足相应标准以及任何其他功能安全、信息安全、监管或其他要求。

这些资源如有变更，恕不另行通知。TI 授权您仅可将这些资源用于研发本资源所述的 TI 产品的应用。严禁对这些资源进行其他复制或展示。您无权使用任何其他 TI 知识产权或任何第三方知识产权。您应全额赔偿因在这些资源的使用中对 TI 及其代表造成的任何索赔、损害、成本、损失和债务，TI 对此概不负责。

TI 提供的产品受 [TI 的销售条款](#) 或 [ti.com](#) 上其他适用条款/TI 产品随附的其他适用条款的约束。TI 提供这些资源并不会扩展或以其他方式更改 TI 针对 TI 产品发布的适用的担保或担保免责声明。

TI 反对并拒绝您可能提出的任何其他或不同的条款。
