

TMP390 超小型、双通道(高低温跳变)、0.5μA 电阻器可编程温度开关

1 特性

- 电阻器可编程的温度跳闸点和迟滞选项
 - 电阻器容差可实现零误差
 - 迟滞选项：5°C、10°C 和 20°C
- 适用于过热或欠温检测的独立输出
 - 通道 A (过热)：+30°C 至 +124°C，阶跃为 2°C
 - 通道 B (欠温)：-50°C 至 +25°C，阶跃为 5°C
- 精度级别选项 (在 -55°C 至 +130°C 范围内达到最大值)：
 - A2 电平：±3.0°C (在 0°C 至 +70°C 范围内为 ±1.5°C)
 - A3 电平：±3.5°C (在 0°C 至 +70°C 范围内为 ±2.0°C)
- 超低功耗：25°C 时为 0.5μA (典型值)
- 电源电压：1.62 至 5.5 V
- 开漏输出
- 跳闸测试功能支持系统内测试
- 采用 SOT-563 (1.60mm × 1.20mm)、6 引脚封装

2 应用

- 直流/交流逆变器
- 直流/直流转换器
- 温度变送器
- 环境控制系统 (ECS)
- 电动工具
- 移动电源
- 无线基础设施
 - WLAN/Wi-Fi 接入点
 - 核心路由器
 - 边缘路由器
 - 宏远程无线电单元 (RRU)

简化版原理图

3 说明

TMP390 器件属于超低功耗、双通道、电阻可编程温度开关系列，可在 -50°C 至 +130°C 范围内对系统过热事件进行保护和检测。TMP390 可提供独立的过热 (热) 和欠温 (冷) 检测。跳闸温度 (T_{TRIP}) 和热迟滞 (T_{HYST}) 选项可由两个位于 SETA 和 SETB 引脚上的 E96 系列电阻器 (1% 容差) 进行编程。通道 A 电阻器的阻值范围为 1.05KΩ 至 909KΩ，具有 48 个不同阻值。通道 B 电阻器的阻值范围为 10.5KΩ 至 909KΩ。

SETA 输入的接地电阻器值可设置通道 A 的 T_{TRIP} 阈值。SETB 输入的接地电阻器值可设置通道 B 的 T_{TRIP} 阈值，两个通道的 T_{HYST} 选项可设置为 5°C 或 10°C，以防止发生不需要的数字输出切换。当 SETB 输入接地，通道 A 运行时具有 20°C 的迟滞。电阻器精度对 T_{TRIP} 精度没有影响。

为使客户能够进行电路板级制造，TMP390 可通过发挥 SETA 或 SETB 引脚功能激活数字输出，从而支持跳闸测试功能。

Pin Functions

PIN		I/O	DESCRIPTION
NO.	NAME		
1	SETA	Input	Channel A temperature set point. Connect a standard E96, 1% resistance between SETA and GND.
2	SETB	Input	Channel B temperature and Hysteresis set point. Connect a standard E96, 1% resistance between SETB and GND.
3	GND	Ground	Device ground.
4	$\overline{\text{OUTB}}$	Logic Output	Channel B logic open-drain active low output. If unused, the output can be left floating or connected to GND.
5	VDD	Supply	Power supply voltage (1.62 V – 5.5 V).
6	$\overline{\text{OUTA}}$	Logic Output	Channel A logic open-drain active low output. If unused, the output can be left floating or connected to GND.

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)^{(1) (2)}

		MIN	MAX	UNIT
Supply voltage	VDD	-0.3	6	V
Voltage at	OUTA, OUTB	-0.3	6	V
Voltage at	SETA, SETB	-0.3	VDD + 0.3	V
Junction temperature, T _J		-55	150	°C
Storage temperature, T _{stg}		-60	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) Powering the device when the operating junction temperature is outside the *Recommended Operating Conditions*, may affect the functional operation of the device. The device must be power cycled after the system has returned to conditions as indicated under *Recommended Operating Conditions*.

6.2 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2000	V
		Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

		MIN	NOM	MAX	UNIT
VDD	Supply voltage	1.62	3.3	5.5	V
V _{OUTA}	Channel A output pull-up voltage (open-drain)			VDD + 0.3	V
V _{OUTB}	Channel B output pull-up voltage (open-drain)			VDD + 0.3	V
I _{SETA}	SETA pin circuit leakage current	-20		20	nA
I _{SETB}	SETB pin circuit leakage current	-20		20	nA
R _{PA}	Pullup resistor connected from $\overline{\text{OUTA}}$ to VDDIO ⁽¹⁾	1	10		kΩ
R _{PB}	Pullup resistor connected from $\overline{\text{OUTB}}$ to VDDIO ⁽¹⁾				
T _A	Operating free-air temperature (specified performance)	-55		130	°C

- (1) Where VDDIO is an independent power supply other than VDD, and shall not exceed (VDD + 0.3) V.

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		TMP390	UNIT
		DRL (SOT)	
		6 PINS	
R _{θJA}	Junction-to-ambient thermal resistance	230	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	103.4	°C/W
R _{θJB}	Junction-to-board thermal resistance	111.6	°C/W
ψ _{JT}	Junction-to-top characterization parameter	5.3	°C/W
ψ _{JB}	Junction-to-board characterization parameter	110.5	°C/W
M _T	Thermal Mass	1.83	mJ/°C

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor IC Package Thermal Metrics](#) application report, (SPRA953).

6.5 Electrical Characteristics

Minimum and maximum specifications are over -55°C to 130°C and VDD = 1.62V - 5.5V (unless otherwise noted); typical specifications are at T_A = 25°C and VDD = 3.3 V.

7 Detailed Description

7.1 Overview

The TMP390 ultra-low power, dual channel, resistor programmable temperature switches enable detection and protection of system thermal events over a wide temperature range. The TMP390 offers independent overtemperature (hot) and undertemperature (cold) detection. The trip temperatures and hysteresis options are programmed by two E96-series (1%) standard decade value resistors on the SETA and SETB pins. The TMP390 can enable a customer board-level manufacturing test through the trip test function that can force the SETA or SETB pins to logic high to activates the digital outputs.

7.2 Functional Block Diagram

图 7-1. Simplified Schematic

7.3 Feature Description

The TMP390 requires two resistors to set the two trip points and hysteresis, according to 表 7-1 and 表 7-2, for the hot and cold channel device. The output of the TMP390 is open-drain and requires two pullup resistors. TI recommends to use a pullup voltage supply that does not exceed VDD + 0.3 V. The pullup resistors used in between the $\overline{\text{OUTA}}$ and $\overline{\text{OUTB}}$ pins and the pullup supply should be greater than 1 k Ω . The device powers on when the supply voltage goes beyond 1.5 V, and starts sampling the input resistors to set the two trip points and hysteresis value after power-on. These values will remain the same until the device goes through a power cycle. After the device sets the trip points and hysteresis level, the device will update the output every half a second. The conversion time is typically 0.65 ms when the temperature is checked against the trip points and the outputs are updated. The device remains in standby mode between conversions. If either channel is not used, the output can be grounded or left floating.

7.3.1 TMP390 Programming Tables

The temperature threshold and hysteresis options for the TMP390 device are programmed using two external 1% E96 standard resistors. The specific resistor value to ground on the SETA input sets the temperature threshold of channel A. The specific resistor value to ground on the SETB input sets the temperature threshold of channel B, as well as the hysteresis for both channel A and channel B.

7.3.2 Trip Test

The purpose of the trip test is in system manufacturing test without putting the TMP390 through costly temperature verification of the assembly of TMP390 and pullup resistors. When the SETA or SETB pin is set to a high logic level, the associated output goes low. When the input pin level goes low, the output goes to its previous condition before the trip test. The trip test does not affect the current condition of the device. The trip test signals should stay above $0.8 \times VDD$ for logic high and below $0.2 \times VDD$ for logic low.

The trip test operation is shown in [图 7-2](#). The trip test must be performed with a single toggle when the device is operating at a temperature that will not cause the corresponding output to trip. The trip test is intended for production testing after assembly, and must not be used as a functional feature.

图 7-2. TMP390 Trip Test Operation

7.3.3 20°C Hysteresis

The 20°C hysteresis feature is only available on Channel A. To activate the feature, the SETB pin must be connected to ground and SETA pin connected to the resistor to set the appropriate trip point on Channel A.

7.4 Device Functional Modes

The device has one mode of operation, as described above, that applies when operated within the *Recommended Operating Conditions*.

8 Application and Implementation

备注

以下应用部分中的信息不属于 TI 器件规格的范围，TI 不担保其准确性和完整性。TI 的客户应负责确定器件是否适用于其应用。客户应验证并测试其设计，以确保系统功能。

8.1 Applications Information

The TMP390 device is part of a family of ultra-low power, dual channel, resistor programmable temperature switches that can enable detection and protection of system thermal events over a wide temperature range. The trip temperatures (T_{TRIP}) and hysteresis options are programmed by two E96-series (1%) standard decade value resistors on the SETA and SETB pins. The thermal hysteresis (T_{HYST}) function is to prevent undesired digital output switching due to small temperature changes.

8.2 Typical Applications

8.2.1 Simplified Application Schematic

图 8-1 shows the simplified schematic where R_{SETA} and R_{SETB} are used to set channel A trip point (SETA) and channel B trip point and hysteresis for both channels (SETB). SETA and SETB can be programmed at a variety of temperatures based on the device, as described in 表 7-1 for channel A trip point, and 表 7-2 for channel B trip point and hysteresis for both channels. $\overline{OUTA}$ and $\overline{OUTB}$ outputs correspond to the temperature threshold detection at SETA and SETB, respectively.

图 8-1. Simplified Schematic

8.2.1.1 Design Requirements

The TMP390 requires two resistors to set the high and low trip points and hysteresis, and two pullup resistors for the open-drain device. TI also highly recommends to place a 0.1- μ F, power-supply bypassing capacitor close to the VDD supply pin. To minimize the internal power dissipation, use two pullup resistors greater than 1 k Ω from the $\overline{OUTA}$ and $\overline{OUTB}$ pins to the VDD pin. A separate supply, VDDIO, may be used for the pullup voltage to set the output voltage level to the level required by the MCU, as shown in 图 8-1. The open-drain output gives flexibility of pulling up to any voltage independent of VDD (VDDIO must be less than or equal to VDD + 0.3 V). This allows for use of longer cables or different power supply options. If a separate voltage level is not required, TI recommends to tie the pullup to the TMP390 VDD.

If the SETA or SETB connected resistor value is outside the legal range, the associated output goes to permanent output zero stage and the channel cannot be used. The other channel still will be in operating condition, and device can be used in one channel mode. If the SETB input is grounded or left floating, the Channel B cannot be used and the hysteresis for Channel A will be 20°C. The SETA and SETB connected resistors are measured during POR. If two consecutive measurements are not matching each other, then the device sets the associated channel output to zero and repeats the resistor measurements until the measurements match. When the measurements match, the channel output is released. Note that it is possible to connect some device outputs together by shorting the $\overline{OUTA}$ or $\overline{OUTB}$ line.

8.2.1.2 Detailed Design Procedure

The resistor to ground values on the SETA input sets the T_{TRIP} threshold of Channel A. The resistor to ground value on the SETB input sets the T_{TRIP} threshold of Channel B as well as the T_{HYST} 5°C and 10°C options. TI recommends that the resistors at SETA and SETB have a 1% tolerance at room temperature. Each resistor can range from 1.05 K Ω to 909 K Ω , representing one of 48 unique values. The exact temperature thresholds and trip points are shown in 表 7-1 and 表 7-2. The pullup resistors should be at least 1 k Ω to minimize internal power dissipation. To get the correct threshold for resistor values, take care to minimize the board level capacitance and leakage at the SETA and SETB pins.

The waveform for the TMP390 output under the hot/cold thresholds is shown in 图 8-2. The hysteresis can be set to 5°C, 10°C or 20°C. When the temperature exceeds the hot trip point threshold, $\overline{OUTA}$ goes low until the temperature drops below the hysteresis threshold. When the temperature drops below the cold trip threshold, $\overline{OUTB}$ goes low and returns high after the temperature rises above the hysteresis threshold. If the switch has already tripped and the temperature is in the hysteresis band, a POR event will cause the output to go high after the power is restored.

8.2.1.3 Application Curves

图 8-2. TMP390 Output With Hot/Cold Thresholds With Hysteresis

8.2.2 TMP390 With 10°C Hysteresis

图 8-3 shows an example circuit for overtemperature and undertemperature protection using the TMP390. In this example, the trip points are set at -25°C and $+90^{\circ}\text{C}$ with 10°C hysteresis.

图 8-3. TMP390 Example Circuit at $+90^{\circ}\text{C}$ and -25°C Thresholds With 10°C Hysteresis

8.2.2.1 Design Requirements

In this example, VDD can be $\geq 3\text{ V}$. The output pins may be tied to a switch to control a fan or other analog circuitry. 图 8-3 uses $10\text{-k}\Omega$ pullup resistors at the $\overline{\text{OUTA}}$ and $\overline{\text{OUTB}}$ outputs. Place a $0.1\text{-}\mu\text{F}$ bypass capacitor close to the TMP390 device to reduce noise coupled from the power supply. If needed, the output of multiple parts can be connected together.

8.2.2.2 Detailed Design Procedure

SETA sets the $+90^{\circ}\text{C}$ threshold using $78.7\text{ k}\Omega$. SETB sets the -25°C trip point and 10°C hysteresis using $215\text{ k}\Omega$. These values were determined using 表 7-1 and 表 7-2. These resistors should have maximum of 1% tolerance and $100\text{ ppm}/^{\circ}\text{C}$ or less over the desired temperature range. A summary of the resistor settings used in this example is shown in 表 8-1. See 表 7-1 and 表 7-2 for additional trip points and hysteresis configurations.

The switching output of the TMP390 can be visualized with the output diagram shown in 图 8-4. It is key to notice that hysteresis is subtracted from the Channel A threshold and added to the Channel B threshold values. $\overline{\text{OUTA}}$ remains high until the sensor reaches $+90^{\circ}\text{C}$ where the output goes low, and returns high after the temperature drops back down to $+80^{\circ}\text{C}$. $\overline{\text{OUTB}}$ trips when the temperature stays below -25°C and goes low until the temperature rises above -15°C .

表 8-1. Example Resistor Settings and Trip Points

CHANNEL	RESISTOR SETTING (kΩ)	HYSTERESIS ($^{\circ}\text{C}$)	TRIP TEMPERATURE ($^{\circ}\text{C}$)
SETA	78.7	10	+90
SETB	215		-25

8.2.3.1 Application Curve**图 8-6. TMP390 One Channel (Hot) Operation Thresholds and Hysteresis**

8.2.4 One Channel Operation for Cold Trip Point

图 8-7 shows the TMP390 configured for one channel operation, with a single resistor to set the warm trip point and hysteresis. The resistor values for one channel warm trip point is same as described in 表 7-2.

图 8-7. TMP390 One Channel (Cold) Operation Example Circuit With -20°C Trip Point and 10°C Hysteresis

8.2.4.1 Application Curve

图 8-8. TMP390 One Channel (Cold) Operation Thresholds and Hysteresis

9 Power Supply Recommendations

The low supply current and wide supply range of the TMP390 allow the device to be powered from many sources. VDDIO must always be lower than or equal to VDD + 0.3 V.

Power supply bypassing is strongly recommended by adding a 0.1-µF capacitor from VDD to GND. In noisy environments, TI recommends to add a filter with 0.1-µF capacitor and 100-Ω resistor between external supply and VDD to limit the power supply noise.

10 Layout

10.1 Layout Guidelines

The TMP390 is extremely simple to layout. Place the power supply bypass capacitor as close to the device as possible, and connect the capacitor as shown in 图 10-1. Place the R_{SETA} and R_{SETB} resistors as close to the device as possible. Carefully consider the resistor placement to avoid additional leakage or parasitic capacitance, as this may affect the actual resistor sense value for the trip thresholds and hysteresis. If there is a possibility of moisture condensation on the SETA and SETB circuits, which may lead to additional leakage current, consider adding a conformal coating to the circuits.

10.2 Layout Example

图 10-1. TMP390 Recommended Layout

11 Device and Documentation Support

11.1 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on [ti.com](https://www.ti.com). Click on *Subscribe to updates* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

11.2 Support Resources

TI E2E™ [support forums](#) are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

11.3 Trademarks

TI E2E™ is a trademark of Texas Instruments.

所有商标均为其各自所有者的财产。

11.4 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

11.5 Glossary

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TMP390A2DRLR	ACTIVE	SOT-5X3	DRL	6	4000	RoHS & Green	NIPDAUAG	Level-2-260C-1 YEAR	-55 to 130	1C4	Samples

⁽¹⁾ The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

⁽²⁾ **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

⁽³⁾ MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

⁽⁴⁾ There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

⁽⁵⁾ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

⁽⁶⁾ Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
