

# TPS652353 具有 I<sup>2</sup>C 接口的 LNB 稳压器

## 1 特性

- 用于 LNB 和 I<sup>2</sup>C 接口的完整集成解决方案
- 兼容 DiSEqC 2.x 和 DiSEqC 1.x
- 支持 5V、12V 和 15V 电源轨
- 高达 1000mA 的外部电阻器可调精确输出电流限制
- 升压开关峰值电流限制，与 LDO 电流限制成正比
- 具有 140mΩ 低 R<sub>ds(on)</sub> 内部电源开关的升压转换器
- 可选择 1MHz 或 500kHz 升压开关频率
- 在强制 PWM 模式下能避免可闻噪声
- 适用于非 I<sup>2</sup>C 应用的专用使能引脚
- 具有推挽式输出级的低压降 (LDO) 稳压器，用于提供 VLNB 输出
- 内置精确的 22kHz 音调发生器并支持外部音调输入
- 支持 44kHz 和 22kHz 外部音调输入
- 可调节软启动和 13V 至 18V 电压转换时间
- 650mV 至 750mV 的 22kHz 音调振幅选择
- 可选过流时间 29ms/58ms
- 通过在 EN 为低电平时进行访问的 I<sup>2</sup>C 寄存器
- 短路动态保护
- 输出电压电平、DiSEqC 音调输入和输出、电流电平以及电缆连接诊断
- 具有过热保护功能
- 20 引脚 WQFN 3mm x 3mm (RUK) 封装

## 2 应用

- 机顶盒卫星接收器
- 电视卫星接收器
- PC 卡卫星接收器
- 卫星电视

## 3 说明

TPS652353 专为模拟和数字卫星接收器而设计，是一款具有 I<sup>2</sup>C 接口的单片稳压器。该器件专用于向碟形天线中的 LNB 降压转换器或多开关箱提供 13V 至 18V 电源以及 22kHz 音调信号。该器件提供了一套完整的解决方案，具有元件数极少、功率耗散低、设计简单以及采用 I<sup>2</sup>C 标准接口等优点。

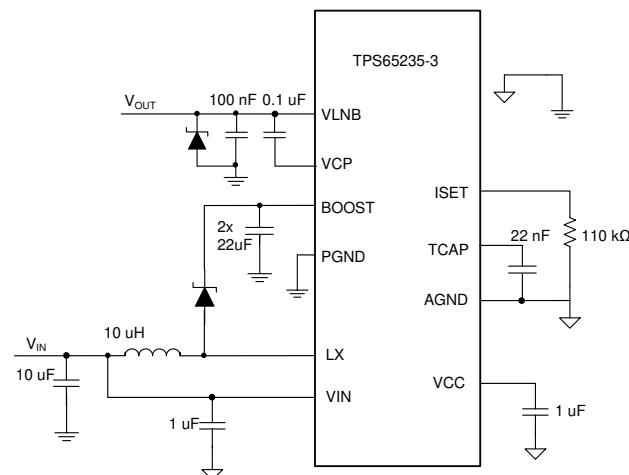

TPS652353 具有高功效。该升压转换器集成了一个在 1MHz 或 500kHz 可选开关频率下运行的 140mΩ 功率 MOSFET。线性稳压器中的压降为 0.8V，能够更大限度地降低功率损耗。TPS652353 提供了多种生成 22kHz 信号的方法。具有推挽式输出级的集成线性稳压器可生成 22kHz 音调信号（在输出端叠加），即使在零负载条件下也是如此。可由外部电阻器以 ±10% 的精度来设定线性稳压器的电流限值。通过 I<sup>2</sup>C 读取的全范围诊断可用于系统监控。

TPS652353 在强制 PWM 模式下具有特殊设计，能避免可闻噪声，尤其是当 VIN 高于或接近 VLNB 输出时。

TPS652353 支持面向 22kHz 音调检测电路和输出接口的高级 DiSEqC 2.x 标准。

### 器件信息

器件型号	封装	封装尺寸 (标称值)

## 5 Pin Configuration and Functions

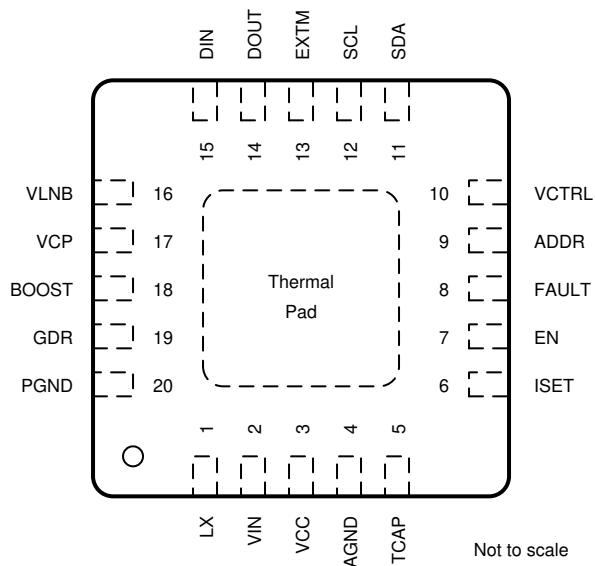

图 5-1. RUK Package. 20-Pin WQFN With Exposed Thermal Pad. Top View.

表 5-1. Pin Functions

PIN		TYPE <sup>(1)</sup>	DESCRIPTION
NO.	NAME		
1	LX	I	Switching node of the boost converter
2	VIN	S	Input of internal linear regulator
3	VCC	O	Internal 6.3-V power supply. Connect a 1- $\mu$ F ceramic capacitor from this pin to ground. When $V_{IN}$ is 5 V, connect the VCC pin to the VIN pin.
4	AGND	S	Analog ground. Connect all ground pins and power pad together.
5	TCAP	O	Connect a capacitor to this pin to set the rise time of the LNB output.
6	ISET	O	Connect a resistor to this pin to set the LNB output current limit.
7	EN	I	Enable this pin to enable the VLNB output, pull this pin to ground to disable the output. The output is then pulled to ground, and, when the EN pin is low, the I <sup>2</sup> C interface can be accessed.
8	FAULT	O	Open drain output pin, it goes low if any fault flag is set.
9	ADDR	I	Connect a different resistor to this pin to set different I <sup>2</sup> C addresses (see the <i>I<sup>2</sup>C Address Selection</i> 表 7-4 table).
10	VCTRL	I	Voltage level at this pin to set the output voltage (see the <i>Logic table</i> 表 7-3).
11	SDA	I/O	I <sup>2</sup> C compatible bidirectional data
12	SCL	I	I <sup>2</sup> C compatible clock input
13	EXTM	I	External modulation logic input pin that activates the 22-kHz tone output. The feeding signal can be 22-kHz tone or logic high or low.
14	DOUT	O	Tone detection output
15	DIN	I	Tone detection input
16	VLNB	O	Output of the power supply connected to satellite receiver or switch
17	VCP	O	Gate drive supply voltage and output of charge pump. Connect a capacitor between this pin and the VLNB pin.
18	BOOST	O	Output of the boost regulator and Input voltage of the internal linear regulator
19	GDR	O	Control the gate of the external MOSFET for DiSEqc 2.x support
20	PGND	S	Power ground for the boost converter
—	Thermal Pad	—	The thermal pad must be soldered to the printed circuit board (PCB) for optimal thermal performance. Use thermal vias on the PCB to enhance power dissipation.

(1) I = input, O = output, I/O = input and output, S = power supply

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

		MIN	MAX	UNIT
Voltage	VIN, LX, BOOST, VLNB	- 1	30	V
	VCP, GDR (referenced to VLNB pin)	- 0.3	7	
	VCC, EN, ADDR, FAULT, SCL, SDA, VCTRL, EXTM, DOUT, DIN, TCAP	- 0.3	7	
	ISET	- 0.3	3.6	
	PGND	- 0.3	0.3	
Operating junction temperature, T <sub>J</sub>		- 40	150	°C
Storage temperature, T <sub>stg</sub>		- 55	150	

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

### 6.2 ESD Ratings

		VALUE	UNIT
V <sub>(ESD)</sub>	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±4000
		Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup>	±1500

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V <sub>IN</sub>	Input operating voltage	4.5	20	20	V
T <sub>A</sub>	Operating junction temperature	- 40		125	°C

### 6.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		TPS652353	UNIT
		RUK (WQFN)	
		20 PINS	
R <sub>θ JA</sub>	Junction-to-ambient thermal resistance	44.8	°C/W
R <sub>θ JC(top)</sub>	Junction-to-case (top) thermal resistance	47.3	°C/W
R <sub>θ JB</sub>	Junction-to-board thermal resistance	16.5	°C/W
ψ <sub>JT</sub>	Junction-to-top characterization parameter	0.5	°C/W
ψ <sub>JB</sub>	Junction-to-board characterization parameter	16.4	°C/W
R <sub>θ JC(bot)</sub>	Junction-to-case (bottom) thermal resistance	3.6	°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics application report](#).

## 7 Detailed Description

### 7.1 Overview

The TPS652353 device is the power management IC (PMIC) that integrates a boost converter, an LDO regulator, and a 22-kHz tone generator to serve as a LNB power supply. This solution compiles the DiSEqC 2.x standard with or without I<sup>2</sup>C interface. An external resistor allows for precise programming of the output current limit. The 22-kHz tone signal can be generated in one of two ways, either with or without I<sup>2</sup>C. The integrated boost features low  $R_{ds(on)}$  MOSFET and internal compensation. A selectable switching frequency of 1 MHz or 500 kHz is designed to reduce the size of passive components and be flexible for design.

The TPS652353 device can support the 44-kHz tone output. When the EXTM pin has a 44-kHz tone input, and the EXTM TONE bit in the *Control Register 1* is set to 1b, the LNB tone output is 44 kHz. By default, the TPS652353 device has a typical 22-kHz tone output.

### 7.2 Functional Block Diagram

### 7.3 Feature Description

#### 7.3.1 Boost Converter

The TPS652353 device has an internal compensated boost converter and low-dropout (LDO) linear regulator. The boost converter tracks the LNB output voltage within 800 mV even at loading 1000 mA, which minimizes power loss.

The boost converter operates at 1 MHz by default. The TPS652353 device has internal cycle-by-cycle peak current limit in the boost converter and DC current limit in the LNB output to help protect the device from short

circuits and over loading. When the LNB output is shorted to ground, the LNB output current is clamped at the LDO current limit. The LDO current limit is set by the external resistor at the ISET pin. The current limit of the boost switch is proportional to the LDO current limit. If an overcurrent condition occurs for more than 29 ms, the boost converter enters hiccup mode and retries startup in 233 ms. This hiccup mode ON time and OFF time are selectable through the I<sup>2</sup>C control register (address 0x01) to be either 29 ms and 233 ms or 58 ms and 466 ms, respectively. At extremely light loads, the boost converter automatically operates in a pulse-skipping mode.

The boost converter is stable with either ceramic capacitor or electrolytic capacitor.

If two or more set-top box LNB outputs are connected together, one output voltage can be set higher than others. The output with the lower set voltage is then effectively turned off. When the voltage drops to the set level, the LNB output with the lower set output voltage returns to normal conditions.

### 7.3.2 Linear Regulator and Current Limit

The linear regulator is used to generate the 22-kHz tone signal by changing the LDO reference voltage. The linear regulator features low-dropout voltage to minimize power loss while maintaining enough head room for the 22-kHz tone with 650-mV amplitude. The linear regulator also implements a tight current limit for overcurrent protection. The current limit is set by an external resistor connected to ISET pin. [Linear Regulator Current Limit Vs Resistor](#) shows the relationship between the current limit threshold and the resistor value.

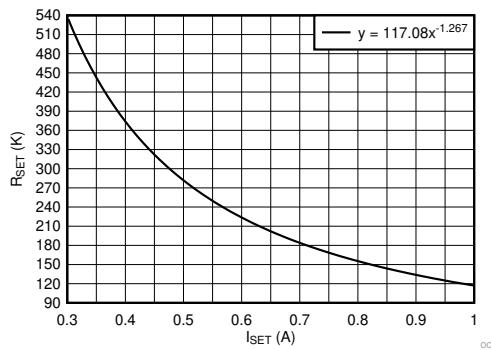

图 7-1. Linear Regulator Current Limit Vs Resistor

$$R_{SET}(k\Omega) = 117.08 \times I_{SET}^{-1.267} (A) \quad (1)$$

A 200-k $\Omega$  resistor sets the current to 0.65 A, and 110-k $\Omega$  resistor sets the current to approximately 1 A.

### 7.3.3 Boost Converter Current Limit

The boost converter has the cycle-by-cycle peak current limit on the internal Power MOSFET switch to serve as the secondary protection when LNB output is hard short. With ISW bit default setting 0b on I<sup>2</sup>C control register 0x01, the switch current limit I<sub>SW</sub> is proportional as LDO current limit I<sub>(OCP)</sub> set by ISET pin resistor, and the relationship can be expressed as:

$$I_{SW} = 3 \times I_{(OCP)} + 0.8A \quad (2)$$

For the 5 V V<sub>IN</sub>, if LNB current load is up to 1 A, the ISW bit should be written as 1b, the switch current limit I<sub>SW</sub> for the internal Power MOSFET is:

$$I_{SW} = 5 \times I_{(OCP)} + 0.8A \quad (3)$$

While due to the high power loss at 5 V, V<sub>IN</sub>, it has a chance to trigger the thermal shutdown before the loading is up to 1 A, especially the VLNB output is high.

### 7.3.4 Charge Pump

The charge pump circuitry generates a voltage to drive the NMOS of the linear regulator. The voltage across the charge pump capacitor between VLNB and VCP is about 5.4 V, so the absolute value of the VCP voltage will be VLNB + 5.4 V.

### 7.3.5 Slew Rate Control

When LNB output voltage transits from 13.4 V to 18.2 V or 18.2 V to 13.4 V, the cap at pin TCAP controls the transition time. This transition time makes sure the boost converter output to follow LNB output change. Usually boost converter has low bandwidth and can't response fast. The voltage at TCAP acts as the reference voltage of the linear regulator. The boost converter's reference is also based on TCAP with additional fixed voltage to generate a 0.8 V above the LNB output.

The charging and discharging current is 10  $\mu$ A, thus the transition time can be estimated as:

$$t_{TCAP}(\text{ms}) = 0.8 \times \frac{C_{SS}(\text{nF})}{I_{SS}(\mu\text{A})} \quad (4)$$

A 22-nF capacitor generates about 2 ms transition time.

In light load conditions, when LNB output voltage is set from 18.2 V to 13.4 V, the voltage drops very slow, which causes wrong VOUT\_GOOD (Bit 0 at status register 0x02) logic for LNB output voltage detection. TPS652353 has integrated a pull down circuit to pull down the output during the transition. This ensures the voltage change can follow the voltage at TCAP. When the 22-kHz tone signal is superimposing on the LNB output voltage, the pull down current can also provide square wave instead of a distorted waveforms.

### 7.3.6 Short Circuit Protection, Hiccup and Overtemperature Protection

The LNB output current limit can be set by an external resistor. When short circuit conditions occur or current limit is triggered, the output current is clamped at the current limit for 29 ms or 58 ms with LDO on. If the condition retains, the converter will shut down for 233 ms or 466 ms and then restart. This hiccup behavior prevents IC from being overheated. The hiccup ON/OFF time can be set by I<sup>2</sup>C register. Refer to [Control Register 1](#) for detail.

The low side MOSFET of the boost converter has a peak current limit threshold which serves as the secondary protection. If boost converter's peak current limit is triggered, the peak current will be clamped as high as 3.8 A when setting I<sub>SW</sub> default and LNB current limit up to 1 A. If loading current continues to increase, output voltage starts to drop and output power drops.

Thermal shutdown prevents the chip from operating at exceedingly high temperatures. When the junction temperature exceeds 160°C, the output shuts down. When the die temperature drops below its lower threshold typically 140°C, the output is enabled.

When the chip is in overcurrent protection or thermal shutdown, the I<sup>2</sup>C interface and logic are still active. The FAULT pin is pulled down to signal the processor. The FAULT pin signal remains low unless the following action is taken:

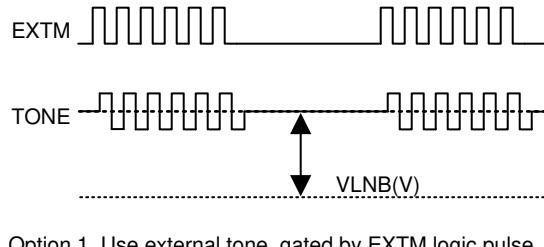

1. If I<sup>2</sup>C interface is not used to control, EN pin must be recycled to pull the FAULT pin back to high.
2. If I<sup>2</sup>C interface is used, the I<sup>2</sup>C master need to read the status [Control Register 2](#), then the FAULT pin will be back to high.

### 7.3.7 Tone Generation

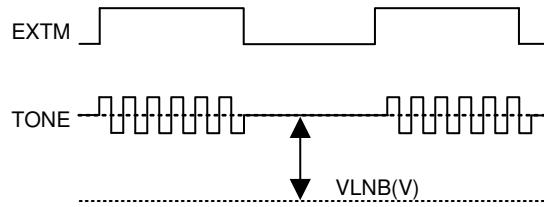

A 22-kHz tone signal is implemented at the LNB output voltage as a carrier for DiSEqC command. This tone signal can be generated by feeding an external 22-kHz clock at the EXTM pin, and it can also be generated with its internal tone generator controlled by EXTM pin. If EXTM pin is toggled to high, the internal tone signal will be superimposed at the LNB output, if EXTM pin is low, there will be no tone superimposed at the output stage of the regulator facilitates a push-pull circuit, so even at zero loading; the 22-kHz tone at the output is still clean without distortion.

There are two ways to generate the 22-kHz tone signal at the output.

For option1, if the EXTM has 44-kHz tone input, and the bit EXTM TONE of the [Control Register 1](#) is set to 1b, the LNB tone output is 44 kHz.

Option 1. Use external tone, gated by EXTM logic pulse

Option 2. Use internal tone, gated by EXTM logic envelop

**图 7-2. Two Ways to Generate 22-kHz tone**

### 7.3.8 Tone Detection

A 22-kHz tone detector is implemented in the TPS652353 solution. The detector extracts the AC-coupled tone signal from the DIN input and provides it as an open-drain signal on the DOUT pin. When the DOUTMODE bit in the [Control Register 2](#) is set to the default setting, if a tone is present, the DOUT output is logic low. If a tone is not present, the internal output FET is off. If a pullup resistor is connected to the DOUT pin, the output is logic high. The maximum tone out delay with respect to the input is one and a half of the tone cycle.

The DOUTMODE bit in the [Control Register 2](#) is reserved and should not be used.

### 7.3.9 Audio Noise Rejection

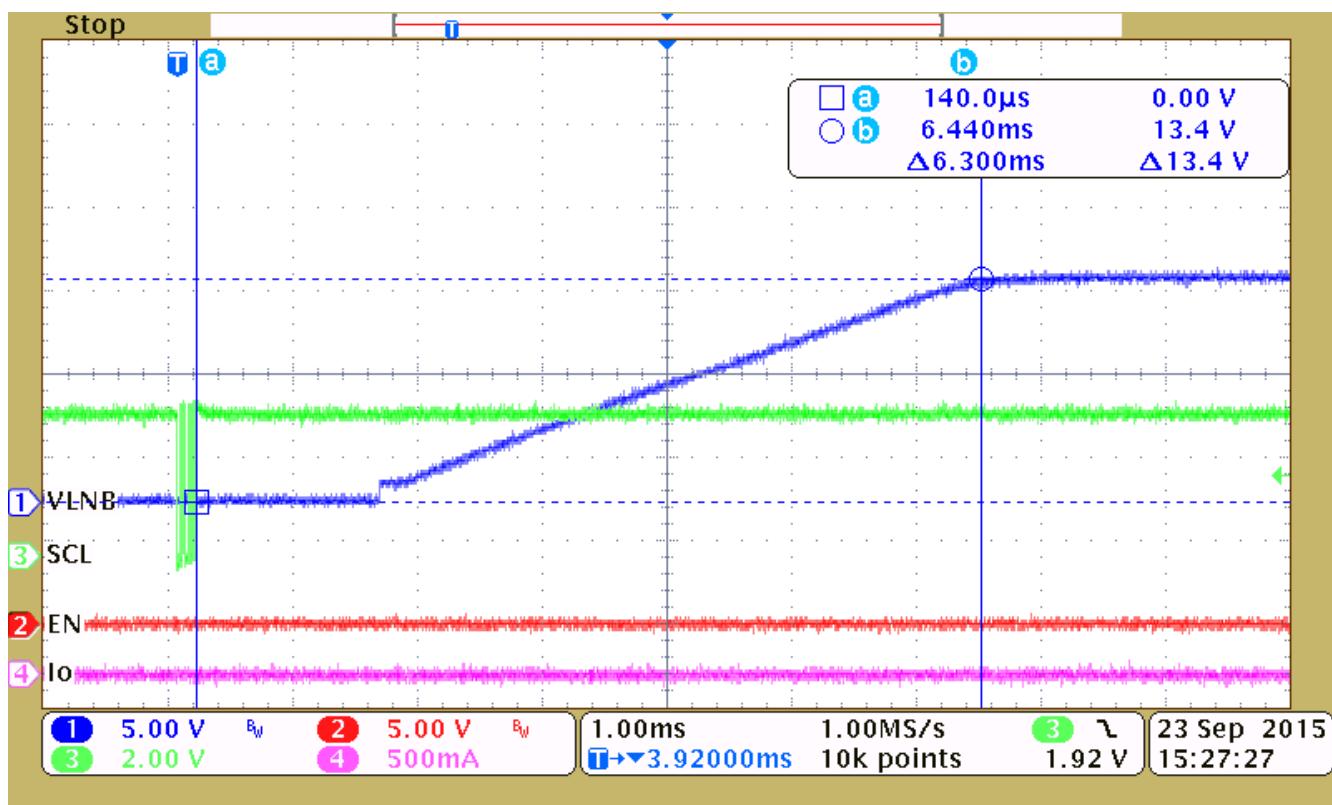

When the TPS652353 operates in PSM mode, locating the switching frequency at the range of audio frequency is possible. Which causes audible noise, especially when the VLNB voltage is lower or closer to the VIN voltage, and the current load is light.

When audible noise occurs, setting the TPS652353 device to operate in Forced PWM mode is recommended. In Forced PWM mode, a special design is implemented to avoid the audible noise.

### 7.3.10 Disable and Enable

The TPS652353 device has a dedicated EN pin to disable and enable the LNB output. In a non-I<sup>2</sup>C application, when the EN pin is pulled high, the LNB output is enabled. When the EN pin is pulled low, the LNB output is disabled. In an I<sup>2</sup>C application, when the EN pin is either low or high, the I<sup>2</sup>C registers can be accessed, which allows users to change the default LNB output at system power-up. When the I2C\_CON bit in the [Control Register 1](#) is set to 1b, the LNB output enable or disable is controlled by the EN bit in the [Control Register 2](#). By default, the I2C\_CON bit of the control register is set to 0b, which makes the LNB output is controlled by the EN pin. [VLNB Output Controlled by bit EN of Control Register 2](#) and [VLNB Output Controlled by EN Pin](#) shows the detailed control behavior.

I<sub>2C\_CON</sub> = 0b

图 7-4. VLNB Output Controlled by EN Pin

## 7.3.11 Component Selection

### 7.3.11.1 Boost Inductor

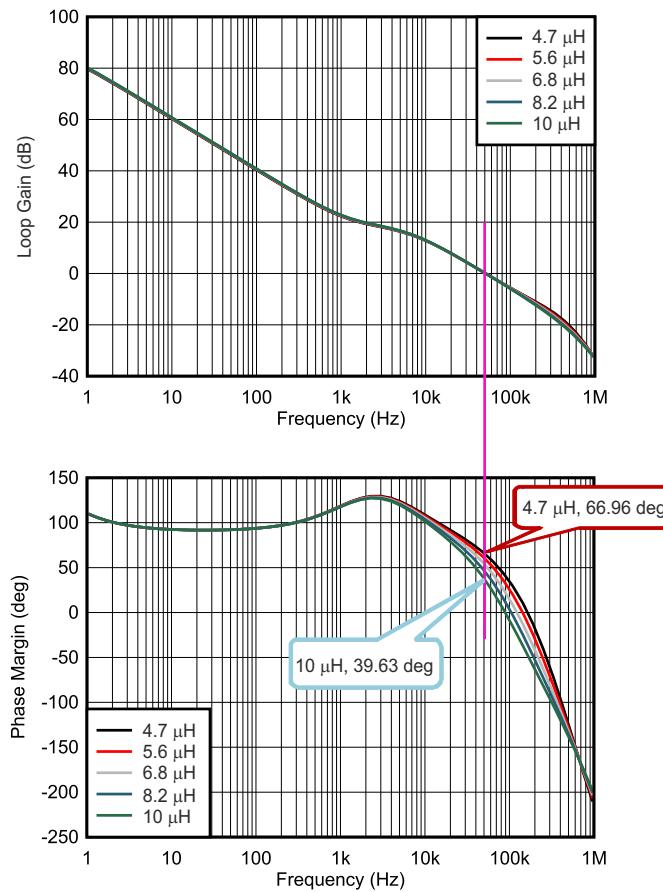

The TPS652353 device is recommended to operate with a boost inductor value of 4.7  $\mu\text{H}$  or 10  $\mu\text{H}$ . The boost inductor must be able to support the peak current requirement to maintain the maximum LNB output current without saturation. Use 方程式 5 to estimate the peak current of the boost inductor ( $I_{\text{peak}}$ ).

$$I_{\text{peak}} = \frac{I_{\text{OUT}}}{1-D} + \frac{1}{2} \times \frac{V_{\text{IN}} \times D}{L \times f_S} \quad (5)$$

where

$$D = 1 - \frac{V_{\text{IN}}}{VLNB + 0.8} \quad (6)$$

With a different inductance, the system has different gain and phase margins. 图 7-5 shows a Bode plot of boost loop with  $2 \times 10 \mu\text{F}$  / 35 V of boost capacitor and 4.7  $\mu\text{H}$ , 5.6  $\mu\text{H}$ , 6.8  $\mu\text{H}$ , 8.2  $\mu\text{H}$ , and 10  $\mu\text{H}$  of boost inductance. As the boost inductance increases, the 0-dB crossover frequency keeps relatively constant while reducing the phase and gain margins. With a 4.7- $\mu\text{H}$  boost inductance, the phase margin is 66.96° and with a 10- $\mu\text{H}$  inductance, the phase margin is 39.63°.

**图 7-5. Gain and Phase Margin of the Boost Loop with Different Inductance**  
 $(V_{IN} = 12 \text{ V}, V_{OUT} = 18.2 \text{ V}, I_{LOAD} = 1 \text{ A}, f_{sw} = 1 \text{ MHz}, 5 \mu\text{F}$ , Typical Bode Plot)

### 7.3.11.2 Capacitor Selection

The TPS652353 device has a 1-MHz nonsynchronous boost converter integrated and the boost converter features the internal compensation network. The TPS652353 device works well with both ceramic capacitor and electrolytic capacitor.

The recommended ceramic capacitors for the TPS652353 application are, at the minimum, rated as X7R/X5R, with a 35-V rating, and a 1206 size for the achieving lower LNB output ripple. 表 7-1 lists the recommended ceramic capacitors list for both 4.7- $\mu\text{H}$  and 10- $\mu\text{H}$  boost inductors.

If more cost-effective design is needed, use a 100- $\mu\text{F}$  electrolytic (low ESR) and a 10- $\mu\text{F}$  or 35-V ceramic capacitor.

**表 7-1. Boost Inductor and Capacitor Selections**

BOOST INDUCTOR	CAPACITORS	TOLERANCE (%)	RATING (V)	SIZE
10 $\mu\text{H}$	2 × 22 $\mu\text{F}$	±10	35	1206
	2 × 10 $\mu\text{F}$	±10	35	1206
4.7 $\mu\text{H}$	2 × 22 $\mu\text{F}$	±10	35	1206
	2 × 10 $\mu\text{F}$	±10	35	1206
	22 $\mu\text{F}$	±10	35	1206

图 7-6 和 图 7-7 show a bode plot of boost loop with 4.7- $\mu\text{H}$  and 10- $\mu\text{H}$  inductance and 4  $\mu\text{F}$ , 5  $\mu\text{F}$ , 7.5  $\mu\text{F}$ , 10  $\mu\text{F}$ , 15  $\mu\text{F}$ , and 20  $\mu\text{F}$  of boost capacitance after degrading. As the boost capacitance increases, the phase margin increases.

### 7.3.11.3 Surge Components

If a surge test is required for the application, the D0 and D2 diodes should be added as the external protection components. If no surge test is required, remove the D0 and D2 diodes. 表 7-2 lists the recommended surge components.

**表 7-2. Surge Components**

DESIGNATOR	DESCRIPTION	PART NUMBER	MANUFACTURER <sup>(1)</sup>
D0	Diode, TVS, Uni, 28 V, 1500 W, SMC	SMCJ28A	Fairchild Semiconductor
D2	Diode, Schottky, 40 V, 2 A, SMA	B240A-13-F	Diodes Inc.

(1) See [Third-party Products Disclaimer](#)

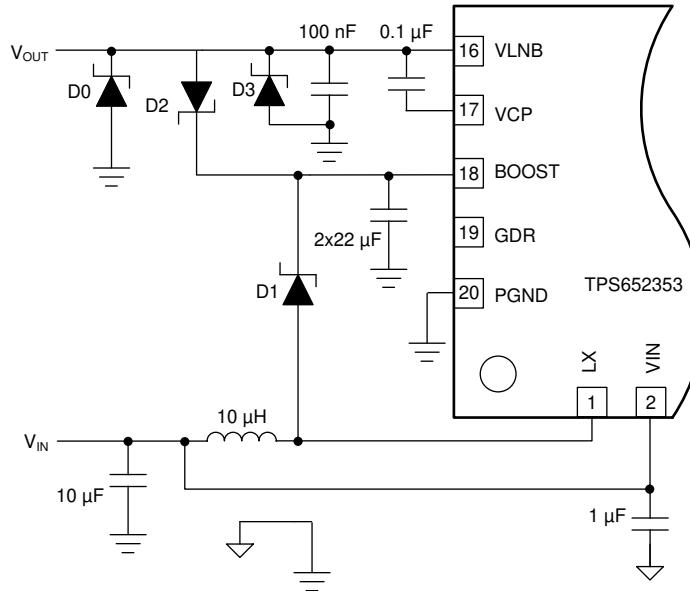

图 7-8. Surge Components Selection

### 7.3.11.4 Consideration for Boost Filtering and LNB Noise

Smaller capacitance on the BOOST pin reduces the cost of the system. However, when the inductor in system is the same, the smaller capacitance on the boost and the larger ripple on the LNB output.

## 7.4 Device Functional Modes

表 7-3 is the logic table for the device.

表 7-3. Logic table

EN	I <sup>2</sup> C_CON <sup>(1)</sup> (2) (3)	SCL	VCTRL	VLN <sup>(4)</sup>
H	0	H	H	19.4 V
H	0	H	L	14.6 V
H	0	L	H	18.2 V
H	0	L	L	13.4 V
X	1	X	X	Controlled by VSET[3:0] bits at 0x01 register <sup>(5)</sup>
L	0	X	X	0 V

(1) I<sup>2</sup>C\_CON is the bit7 of the I<sup>2</sup>C control register 0x01, which is used to set the VLN<sup>B</sup> output controlled by the I<sup>2</sup>C register or not.

(2) When I<sup>2</sup>C interface is used in design, all the I<sup>2</sup>C registers are accessible even if the I<sup>2</sup>C\_CON bit is 0b.

(3) When I<sup>2</sup>C\_CON is 1b, the VLN<sup>B</sup> output is controlled by the I<sup>2</sup>C control register even if the EN pin is low.

(4) When I<sup>2</sup>C interface is used in design, it is recommended to set the I<sup>2</sup>C\_CON with 1b, if not, the LNB output will be variable because the SCL is toggled by the I<sup>2</sup>C register access as the clock signal.

(5) Bit EN of the control register2 is used to disable or enable the LNB output, by default , the bit EN is 1b which enable the LNB output.

## 7.5 Programming

### 7.5.1 Serial Interface Description

I<sup>2</sup>C is a 2-wire serial interface developed by Philips Semiconductor (see I<sup>2</sup>C-Bus Specification, Version 2.1, January 2000). The bus consists of a data line (SDA) and a clock line (SCL) with pullup structures. When the bus is idle, both SDA and SCL lines are pulled high external. All the I<sup>2</sup>C compatible devices connect to the I<sup>2</sup>C bus through open drain I/O pins, SDA and SCL. A master device, usually a microcontroller (MCU) or a digital signal processor (DSP), controls the bus. The master device is responsible for generating the SCL signal and device addresses. The master device also generates specific conditions that indicate the START and STOP of data transfer. A slave device receives, transmits data, or both on the bus under control of the master device.

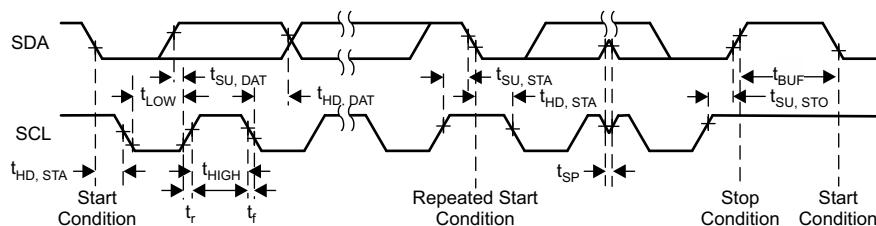

The TPS652353 device works as a slave and supports the following data transfer modes, as defined in the I<sup>2</sup>C Bus Specification: standard mode (100 kbps), and fast mode (400 kbps). The interface adds flexibility to the power supply solution, enabling most functions to be programmed to new values depending on the instantaneous application requirements. Register contents remain intact as long as supply voltage remains above 4.5 V (typical).

The data transfer protocol for standard and fast modes is exactly the same; therefore, they are referred to as F/S-mode in this document. The TPS652353 device supports 7-bit addressing; 10-bit addressing and general call address are not supported.

The TPS652353 device has a 7-bit address set by ADDR pin. 表 7-4 shows how to set the I<sup>2</sup>C address.

**表 7-4. I<sup>2</sup>C Address Selection**

ADDR PIN	I <sup>2</sup> C ADDRESS	ADDRESS FORMAT (A6 ≥ A0)
Connect to VCC	0x08	000 1000b
Floating	0x09	000 1001b
Connected to GND	0x10	001 0000b
Resistor divider to make ADDR pin voltage in 3 V ~ V <sub>CC</sub> - 0.8 V	0x11	001 0001b

**图 7-9. I<sup>2</sup>C Interface Timing Diagram**

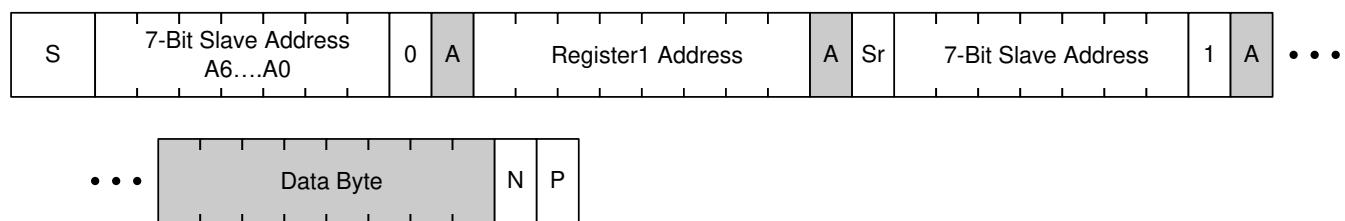

### 7.5.2 TPS652353 I<sup>2</sup>C Update Sequence

The TPS652353 requires a start condition, a valid I<sup>2</sup>C address, a register address byte, and a data byte for a single update. After the receipt of each byte, TPS652353 device acknowledges by pulling the SDA line low during the high period of a single clock pulse. TPS652353 performs an update on the falling edge of the LSB byte.

When the TPS652353 is disabled (EN pin tied to ground) the device cannot be updated via the I<sup>2</sup>C interface.

0b	1b	ON
1b	x	Auto Detect

The TPS652353 has full range of diagnostic flags for operation and debug. Processor can read the status register to check the error conditions. Once the error happens, the flags are changed, once the errors are gone, the flags are set back without I<sup>2</sup>C access.

If the TSD and OCP flags are triggered, FAULT pin will be pulled low, so FAULT pin can be the interrupt signal to processor. Once TSD and OCP are set to 1b, the FAULT pin logic is latched to low, processor need to read this status register to release the fault conditions.

## 8 Application and Implementation

### Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

### 8.1 Application Information

The TPS652353 supports both DiSEqc1.x and DiSEqc2.x application. When the input voltage VIN is greater than the expected output voltage VLNB, the linear regulator drops the voltage difference between VIN and VLNB, which causes the lower efficiency and the higher power loss on the internal linear regulator if the current loading is high. For care must be taken to ensure that the safe operating temperature range of the TPS652353 is not exceeded. TI recommends operating the device in Forced PWM mode when  $V_{IN} > V_{OUT}$  to reduce output ripple.

### 8.2 Typical Application

#### 8.2.1 DiSEqc1.x Support

TPS652353 can operate in I<sup>2</sup>C and non-I<sup>2</sup>C interface mode. [Application for DiSEqc1.x Support](#) shows the application with the device in I<sup>2</sup>C interface mode to support DiSEqC 1.x application. In non-I<sup>2</sup>C mode, the SCL, SDA, and ADDR pins can be floating.

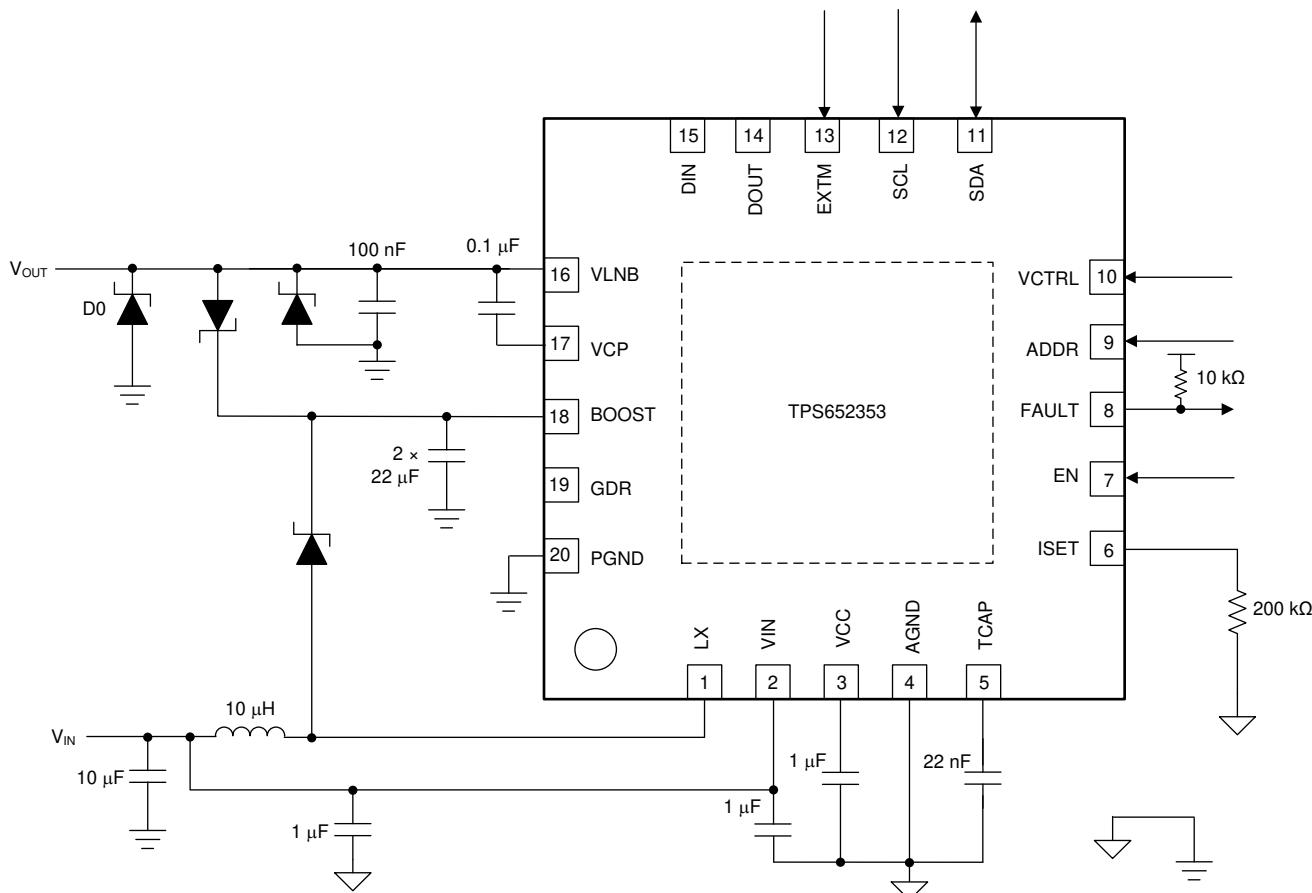

图 8-1. Application for DiSEqc1.x Support

### 8.2.1.1 Design Requirements

For this design example, use the parameters in [表 8-1](#).

**表 8-1. Design Parameters**

PARAMETER	VALUE
Input voltage range, $V_{IN}$	4.5 V to 20 V
Output voltage range $V_{LNB}$	11 V to 21 V
Output current range	0 A to 1 A

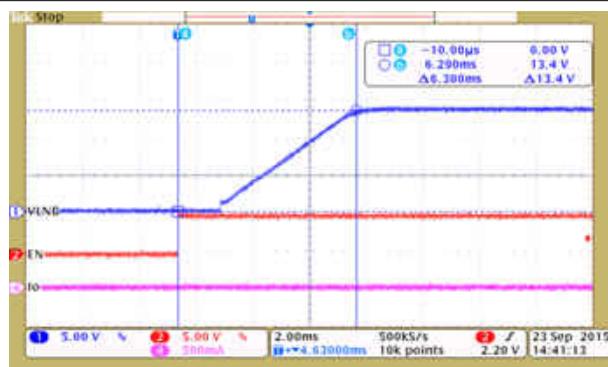

### 8.2.1.2 Detailed Design Procedure

To begin the design process, the following component values must be selected:

- Inductor
  - Choose the appropriate value of the inductor based on application cost requirements, ripple requirements, and [节 7.3.11](#).
- BOOST capacitor
  - Choose the appropriate BOOST capacitor value based on application cost requirements, ripple requirements, and [节 7.3.11](#).
- Diodes
  - The D0 and D2 diodes are used to help meet the surge-protection requirement of the application. If the application does not require surge protection, remove these diodes. For diode component selection, refer to [节 7.3.11.3](#).
  - The D1 diode is used for the boost loop. A Schottky diode is recommended for D1. The application requirements, which include input power range, output power range, and the current requirement, determine the current and voltage capability of the D1 diode.
  - The D3 diode is to help with the output protection for the VLNB voltage. A Schottky diode is recommended for D3. The application requirements determine the current and voltage capability of the D3 diode.

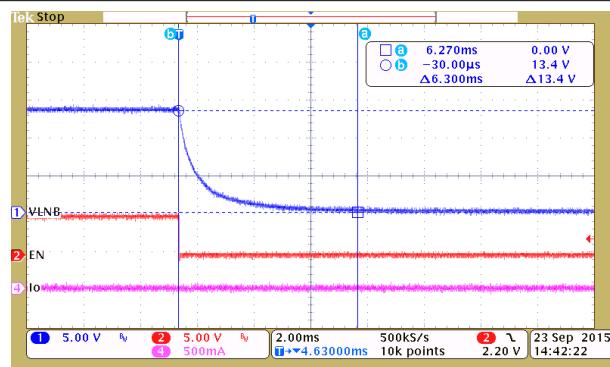

### 8.2.1.3 Application Curves

$T_J = 25^\circ\text{C}$ ,  $V_{IN} = 12 \text{ V}$ ,  $f_{SW} = 1 \text{ MHz}$ ,  $C_{Boost} = (2 \times 22 \mu\text{F} / 35 \text{ V})$  (unless otherwise noted)

## 8.2.2 DiSEqc2.x Support

The TPS652353 can support both DiSEqC 1.x application and DiSEqC 2.x application. [Application Schematic for DiSEqc2.x Support](#) shows the application for supporting DiSEqC 2.x application.

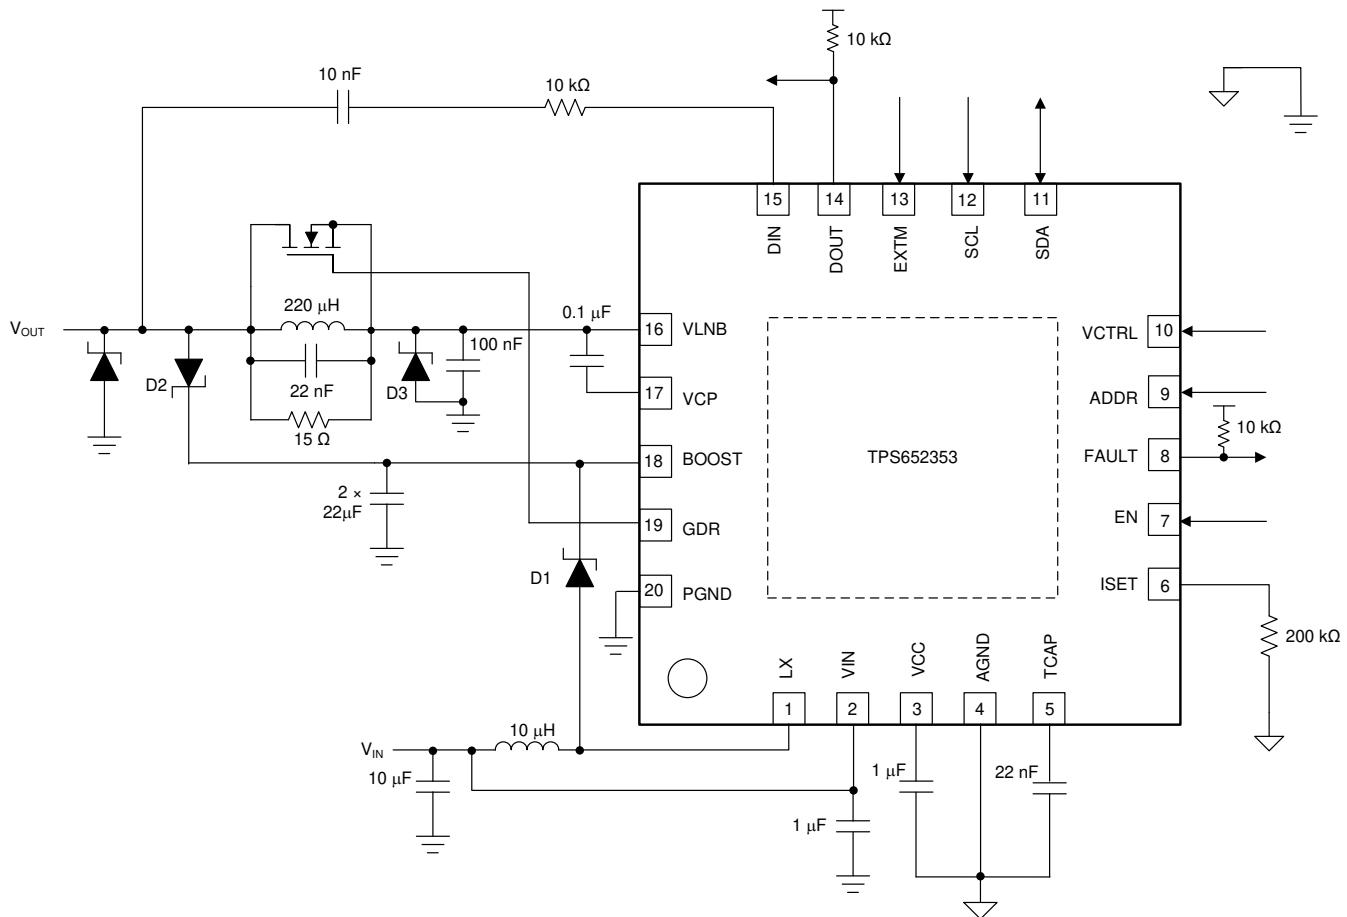

图 8-20. Application Schematic for DiSEqc2.x Support

### 8.2.2.1 Design Requirements

### 8.2.2.2 Detailed Design Procedure

Refer to the [DiSEqc1.x Support](#) section for detailed design procedures.

### 8.2.2.3 Application Curve

Refer to the [DiSEqc1.x Support](#) section for typical application curves. **DOUT Tone Detection Output** is the unique tone-detection curve for the DiSEqC 2.x application.

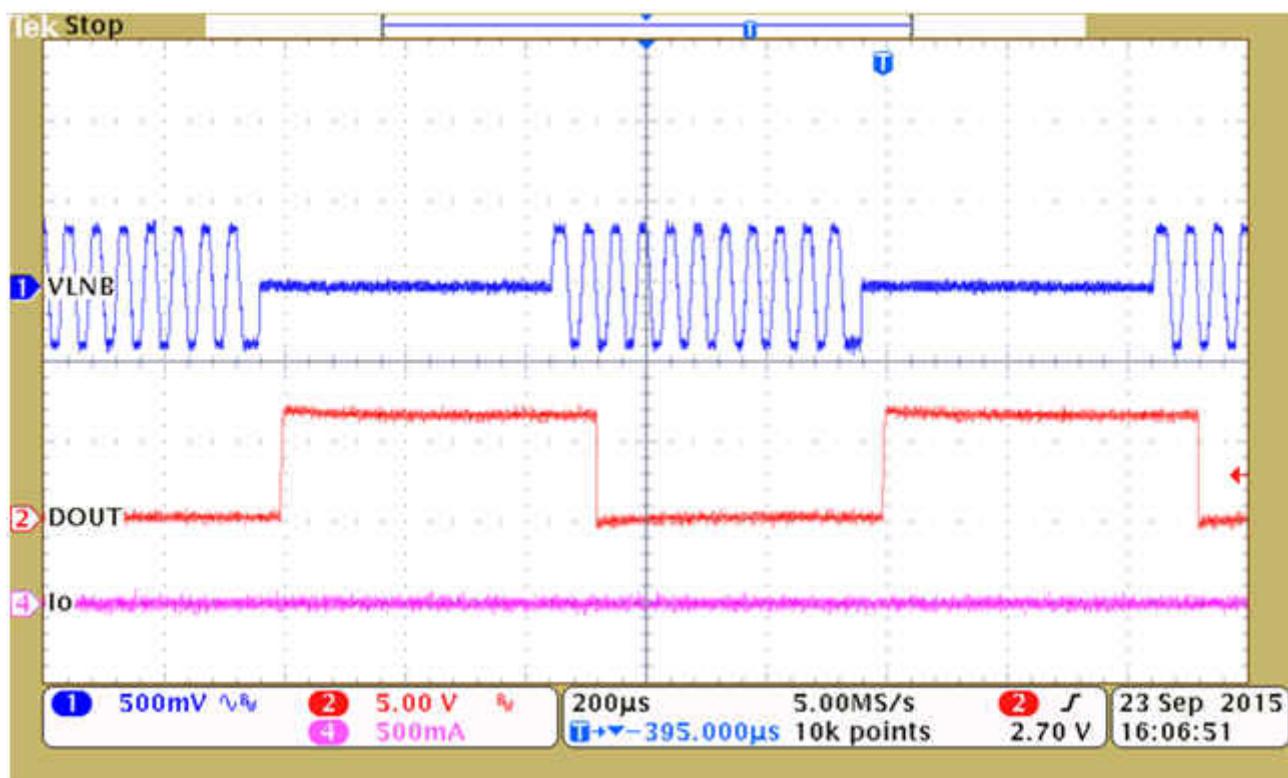

图 8-21. DOUT Tone Detection Output

## 9 Power Supply Recommendations

The device is designed to operate from an input supply ranging from 4.5 V to 20 V. The input supply should be well regulated. If the input supply is located more than a few inches from the converter, an additional bulk capacitance, typically with a value 100  $\mu$ F, may be required in addition to the ceramic bypass capacitors.

## 10 Layout

### 10.1 Layout Guidelines

The TPS652353 is designed to layout in 2 - layer PCB. To ensure reliability of the device, following common printed-circuit board layout guidelines is recommended.

- It is critical to make sure the ground of input capacitor, output capacitor, and the boost converter are connected at one point at same layer.
- The PGND and AGND pins are located in different regions. Connect these grounds to the thermal pad. Other components are connected the AGND pin.
- Put the BOOST capacitors as close as possible.
- The loop from the VIN inductor to the LX pin should be as short as possible.
- The loop from the VIN inductor to D1 Schottky diode to the BOOST should be as short as possible.
- The loop for boost capacitors to the PGND pin should be within the loop from the LX pin to D1 Schottky diode to the BOOST pin.

## 10.2 Layout Example

要接收文档更新通知，请导航至 [ti.com](#) 上的器件产品文件夹。点击 [订阅更新](#) 进行注册，即可每周接收产品信息更改摘要。有关更改的详细信息，请查看任何已修订文档中包含的修订历史记录。

### 11.4 支持资源

[TI E2E™ 支持论坛](#)是工程师的重要参考资料，可直接从专家获得快速、经过验证的解答和设计帮助。搜索现有解答或提出自己的问题可获得所需的快速设计帮助。

链接的内容由各个贡献者“按原样”提供。这些内容并不构成 TI 技术规范，并且不一定反映 TI 的观点；请参阅 TI 的[《使用条款》](#)。

### 11.5 Trademarks

TI E2E™ is a trademark of Texas Instruments.

所有商标均为其各自所有者的财产。

### 11.6 静电放电警告

静电放电 (ESD) 会损坏这个集成电路。德州仪器 (TI) 建议通过适当的预防措施处理所有集成电路。如果不遵守正确的处理和安装程序，可能会损坏集成电路。

ESD 的损坏小至导致微小的性能降级，大至整个器件故障。精密的集成电路可能更容易受到损坏，这是因为非常细微的参数更改都可能会导致器件与其发布的规格不相符。

### 11.7 术语表

#### TI 术语表

本术语表列出并解释了术语、首字母缩略词和定义。

## 12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

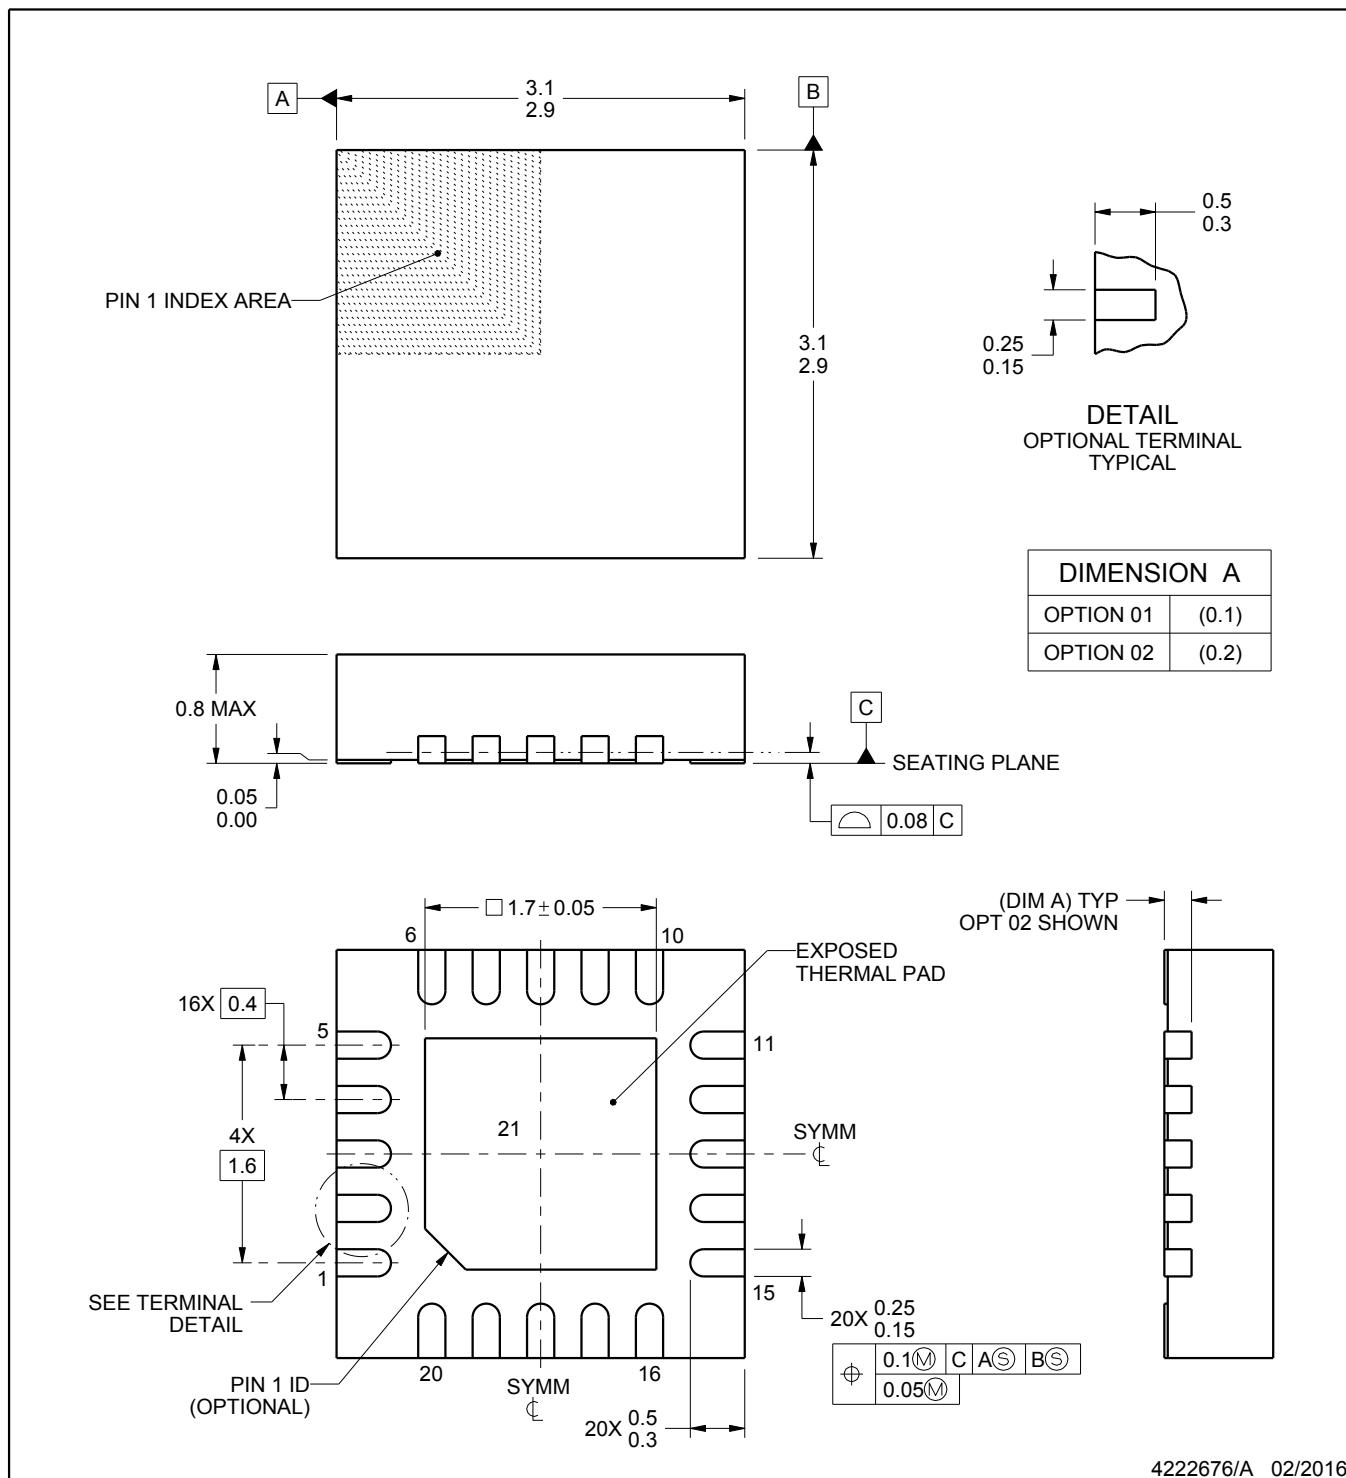

# PACKAGE OUTLINE

RUK0020B

WQFN - 0.8 mm max height

PLASTIC QUAD FLATPACK - NO LEAD

## NOTES:

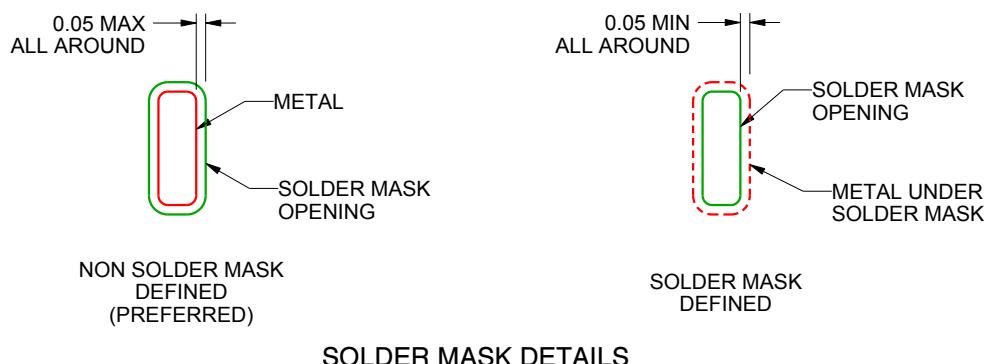

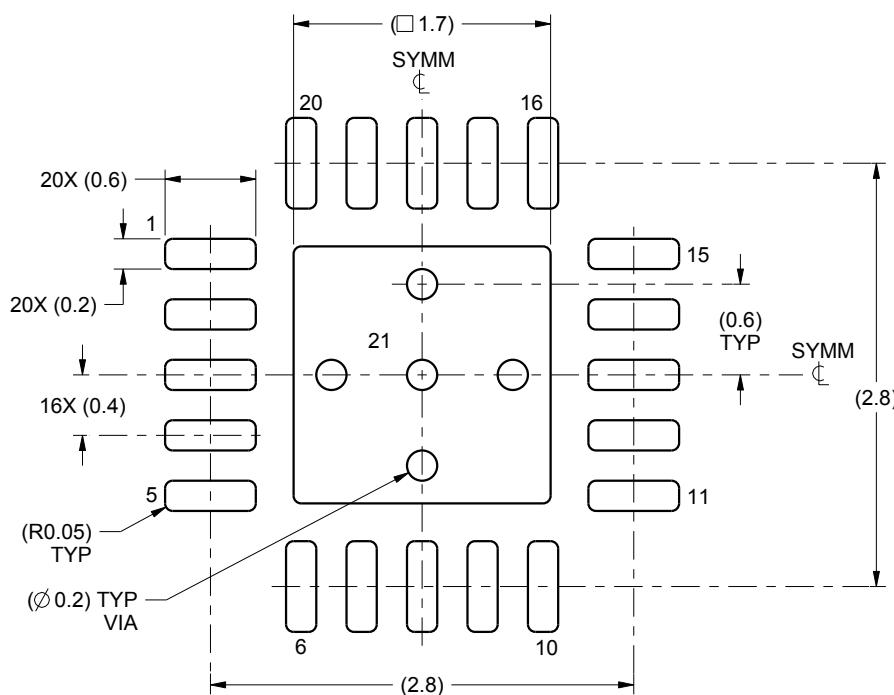

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.

# EXAMPLE BOARD LAYOUT

RUK0020B

WQFN - 0.8 mm max height

PLASTIC QUAD FLATPACK - NO LEAD

4222676/A 02/2016

NOTES: (continued)

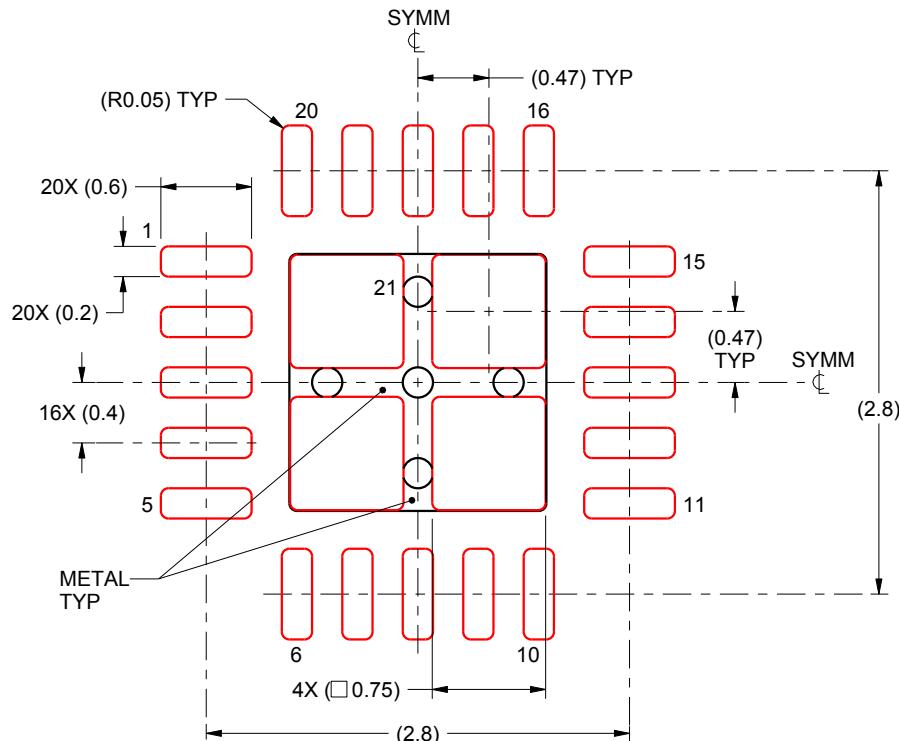

4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 ([www.ti.com/lit/slua271](http://www.ti.com/lit/slua271)).
5. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.

# EXAMPLE STENCIL DESIGN

RUK0020B

WQFN - 0.8 mm max height

PLASTIC QUAD FLATPACK - NO LEAD

## SOLDER PASTE EXAMPLE BASED ON 0.1 mm THICK STENCIL

EXPOSED PAD 21:  
78% PRINTED SOLDER COVERAGE BY AREA UNDER PACKAGE  
SCALE:20X

4222676/A 02/2016

NOTES: (continued)

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

## 重要声明和免责声明

TI“按原样”提供技术和可靠性数据（包括数据表）、设计资源（包括参考设计）、应用或其他设计建议、网络工具、安全信息和其他资源，不保证没有瑕疵且不做出任何明示或暗示的担保，包括但不限于对适销性、某特定用途方面的适用性或不侵犯任何第三方知识产权的暗示担保。

这些资源可供使用 TI 产品进行设计的熟练开发人员使用。您将自行承担以下全部责任：(1) 针对您的应用选择合适的 TI 产品，(2) 设计、验证并测试您的应用，(3) 确保您的应用满足相应标准以及任何其他功能安全、信息安全、监管或其他要求。

这些资源如有变更，恕不另行通知。TI 授权您仅可将这些资源用于研发本资源所述的 TI 产品的应用。严禁对这些资源进行其他复制或展示。您无权使用任何其他 TI 知识产权或任何第三方知识产权。您应全额赔偿因在这些资源的使用中对 TI 及其代表造成任何索赔、损害、成本、损失和债务，TI 对此概不负责。

TI 提供的产品受 [TI 的销售条款](#) 或 [ti.com](#) 上其他适用条款/TI 产品随附的其他适用条款的约束。TI 提供这些资源并不会扩展或以其他方式更改 TI 针对 TI 产品发布的适用的担保或担保免责声明。

TI 反对并拒绝您可能提出的任何其他或不同的条款。
